Where There Is No Dentist
by Murray Dickson

with an Introduction by David Werner,
author of Where There Is No Doctor

Compiled by noonya
This book is certainly not intended to be the last word in community dental care. It is only a beginning. The author hopes to rewrite and improve the book with suggestions from readers.

Note on the use, adaptation, and translation of this book:

Each country is special, with its own particular customs, health needs, and ways of caring for people.

This book, therefore, must be adapted by dental workers in each country, using the language that is common to the local health workers there.

The author would be pleased to assist in any way with those who would translate or adapt the book.

The Hesperian Foundation encourages others to copy, reproduce or adapt to meet local needs, any or all parts of this book, including the illustrations, provided the parts reproduced are distributed free or at cost—not for profit.

Any organization or person who wishes to copy, reproduce or adapt, any or all parts of this book for commercial purposes, must first obtain permission to do so from the Hesperian Foundation.

Please contact the Hesperian Foundation before beginning any translation or adaptation to avoid duplication of efforts, and for suggestions about adapting the information in this book. The foundation would appreciate receiving a copy of any materials in which text or illustrations from this book have been used.

We would like to rewrite this book and incorporate many of your ideas. If you have a suggestion, please write to Murray Dickson at The Hesperian Foundation. Better yet, if you write your own manual, please set aside two copies and send one to The Hesperian Foundation, Box 1692, Palo Alto, California 94302, USA. Send the other to AHRTAG (Appropriate Health Resources and Technologies Action Group), 29-35 Farringdon Road, London EC1M 3JB, England. Both organizations would like to help pass along your ideas to others.
THANKS

Where There Is No Dentist is here to fill a need. To many people, it has seemed that the existing books about dental care were either too incomplete or too complicated. If this book fills that need, it is only because a number of people worked hard to make it happen. To them I owe my sincere thanks.

Much has happened since that day in Papua New Guinea when David Werner’s letter arrived. His challenge was simple: “Since no one else has written a dental manual like this, why don’t you?” With David’s encouragement and constant support, I was able to take teaching notes and produce a suitable draft that was the basis for this book. To you, David, for your patience in helping me learn, my heartfelt thanks. Thanks also to Trude Bock and Bill Bower for the home, food, direction, and support, during a short visit to The Hesperian Foundation in which the book took a definite turn for the better.

Michael Blake deserves special mention. As editor of Where There Is No Dentist, it was he who took the manuscript and nursed it along to completion. Michael’s commitment to finishing the book was vital, and I sincerely appreciate it.

My thanks go to Maggie Leung for typing the final draft, and to those dedicated persons who helped get the book into final form: Annaloy Nickum (page design); Hal Lockwood (typesetting and paste-up); Paul Chandler, Serena Clayton, and Elaine Rossi (proofreading); Pat Bernier (typing); and Howard Uno (photostats).

For their outstanding drawings, I am exceedingly grateful to: June Mehra, Janet Elliott de Jacques, Michael Marzolla, Joan Thompson, Mindy Mead, Arlene Ustin-Cartagena, and Lynn Gordon. My own drawings in the manual appear amateurish in comparison.

I want to thank the many persons who reviewed the manuscript and offered valuable suggestions: Ken Cripwell, Bill Bower, Jeff Vore, Aaron Yaschine, Rosalie Warpeha, Norma Francisco, Mike Muller, Marcia Anderson, Phil Haskett, Bert Ball, Tom Coles, Sunil Mehra, and John Rogers. In particular, thanks to Chris Lennox who, faced with stressful times in Papua New Guinea, found time to read through two drafts; and to David Morley for his ideas for improving the book and his assistance with its eventual publication.

For their financial help, I am grateful to the Ella Lyman Cabot Trust, Muttart Foundation, the Canadian Organization for Development through Education, and the James C. Penney Foundation.

I thank the C.V. Mosby Company and Dr. Kenneth Snawder for permission to adapt several drawings from the Handbook of Clinical Pedodontics, and the Medical Missionary Association (6 Canonbury Place, London N1 2NJ, U.K.) for permission to use parts of David Halestrap’s book Simple Dental Care.

This book is based upon several years of practical experience, made possible by the Canadian Organization CUSO. For this opportunity, and for CUSO’s active interest and involvement in this book, I most gratefully say thanks.

Finally, I want to acknowledge my family’s contribution. For weeks on end, my wife, Gerri, faithfully read and discussed with me each part of the book as it changed and was rewritten. She did this cheerfully, at a time when she was fully occupied in a graduate study program. For much longer than I had anticipated, Gerri and our two boys, Michael and Brennan, had to tolerate my preoccupations.

My parents endured my wanderings and search for answers to human problems with love and a growing sense of understanding. It is my only disappointment that they did not live to see this book in its final form.

INTRODUCTION
by David Werner

A healthy tooth is a living part of the body. It is connected by ‘life-lines’ of blood and nerve to a person’s heart and brain. To separate the tooth from the body, or even to interrupt those ‘life-lines’, means death to the tooth. It also means pain and injury to the body, to the person.

Let us look at it another way. The health of the teeth and gums is related to the health of the whole person, just as the well-being of a person relates to the health of the entire community.

Because of this, the usual separation between dentistry and general health care is neither reasonable nor healthy. Basic care of the teeth and gums—both preventive and curative—should be part of the ‘know-how’ of all primary health care workers. Ideally, perhaps, Where There Is No Dentist should be a part of Where There Is No Doctor. Think of it as a companion volume, both to Where There Is No Doctor and Helping Health Workers Learn.

Murray Dickson has taken care to write this book in a way that will help the readers see dental care as part of community health and development. The approach is what we call ‘people centered.’

Where There Is No Dentist is a book about what people can do for themselves and each other to care for their gums and teeth. It is written for:

- village and neighborhood health workers who want to learn more about dental care as part of a complete community-based approach to health;
- school teachers, mothers, fathers, and anyone concerned with encouraging dental health in their children and their community; and
- those dentists and dental technicians who are looking for ways to share their skills, to help people become more self-reliant at lower cost.

Just as with the rest of health care, there is a strong need to ‘deprofessionalize’ dentistry—to provide ordinary people and community workers with more skills to prevent and cure problems in the mouth. After all, early care is what makes the dentist’s work unnecessary—and this is the care that each person gives to his or her own teeth, or what a mother does to protect her children’s teeth.
While dental disease is decreasing in richer countries, it is on the increase in most poor countries. One reason for this is that people are eating fewer traditional (unrefined) foods and more pre-packaged commercial foods, often sweetened with refined sugar.

Even as the need for dental care is growing, there are still far too few dentists in poor countries. Most of those few work only in the cities, where they serve mostly those who can afford their expensive services.

People in many countries cannot afford to pay for costly professional dental care. Even in rich countries, persons who do not have dental insurance often do not get the attention they need—or go into debt to get it.

Two things can greatly reduce the cost of adequate dental care: popular education about dental health, and the training of primary health workers as ‘dental health promoters’. In addition, numbers of ‘community dental technicians’ can be trained—in 2 to 3 months plus a period of apprenticeship—to care for up to 90% of the people who have problems of pain and infection.

Dentists’ training usually includes complicated oral surgery, root canal work, orthodontics (straightening teeth), and other complex skills. Yet most dentists rarely do more than pull, drill, and fill teeth—skills that require a fraction of the training they have received. The simpler, more common dental problems should be the work of community dental technicians who are on the ‘front lines’ (the villages), with secondary help from dentists for more difficult problems.

Would this reduce quality of service? Not necessarily. Studies have shown that dental technicians often can treat problems as well as or better than professional dentists. In Boston (U.S.A.), for example, a study showed many of the basic treatments commonly given by dentists to be done just as well, and often better, by dental technicians with much shorter training.

Fortunately, in some countries skilled dental technicians have managed to become the major providers of the most needed dental services. In India, there are still ‘street-corner’ dental technicians with foot-pedal drills, who drill and fill teeth at remarkably low cost.

In Honduras, dental technicians (who learn largely from each other, starting as helpers) have formed their own union. Their political strength recently was tested when, in the town of Trujillo, a dentist tried to put a technician out of business. The local technician had removed an infected root left mistakenly by the dentist. The technician had commented on the dentist’s carelessness, and the dentist heard about it. The dentist sent a policeman who shut down the technician’s office and took away his tools. However, the dental technicians’ union took this to court. They argued their rights to practice dentistry, because they are the only persons...
working in marginal communities where dentists’ prices are too high for the people. The court decided in favor of the technicians, and ordered the dentist to return the technician’s tools and pay him for work lost.

In other countries dentists and community dental workers work in closer harmony. In Guatemala, Ecuador, Papua New Guinea, and Mozambique, dental technicians are now recognized by the Ministries of Health. In Papua New Guinea and Ecuador, professional dentists train and supervise them to provide dental care to school children. In Ecuador, they work mostly as dentist assistants, bringing high quality services to more people while decreasing costs. The ‘dental therapists’ in Papua New Guinea are trained to extract, drill, and fill teeth, as well as to work on prevention of dental problems in school children.

In Guatemala and Mozambique, dentists from the dental school have trained village health promoters as dental workers who work with people of all ages. Their training includes community dental health education, cleaning of teeth, extractions, and drilling and filling. These health workers are provided with the few basic instruments needed to provide these services.

In Project Piaxtla, Mexico (with which I and the Hesperian Foundation have worked for many years), visiting dentists have also helped train village ‘dentics’. They, in turn, now teach basic dental skills to the part-time village health workers. These village dentics, some of whom have had only 3 to 6 years of primary school, now practice—and teach—a wider range of dental skills than the average dentist. Their activities include dental health campaigns with school children, community puppet shows about low-cost dental self-care, cleaning of teeth, extractions, drilling and filling, and the making of dentures (false teeth). Several of the dental workers can now do root canal work—a special treatment to remove the central nerve in order to save an infected tooth. One of the village dentics, remembering what he had seen a dentist do, taught himself how to do root canals when his girlfriend had an infected front tooth that he did not want to pull. (He had also learned to check the tooth from time to time afterward to make sure this treatment had been successful.)

We still have much to learn about dental health. Dentists need to learn from the knowledge of the local people, as well as the people from the dentists.

We have learned that villagers with little formal education often can learn skills with their hands—such as tooth extractions, puppetry, or surgery—much faster than university students (who have never learned to use their hands for much more than pushing pencils). We also have observed that the best way to learn dentistry is not through school but through practice, helping someone with more experience who is willing to teach.
Where There Is No Dentist has 2 parts. The first part (Chapters 1-5) discusses teaching and learning about preventive care. It begins by encouraging the health worker to examine herself and her family. To be a good example is the best way to teach.

The second part (Chapters 6-11) talks about diagnosing and treating common dental problems. It is especially for those who live where they cannot reach or afford a dentist. A poor neighborhood in the city can be as distant and neglected as a far-off village. This second part is intended mainly for health workers who have helped organize people to meet their own needs.

Murray Dickson—a Canadian with primary care experience in Northern Canada, Nigeria, Papua New Guinea, and Mozambique—has written this book in clear, simple language. He takes care to use popular names instead of unfamiliar scientific words. For example, instead of speaking of ‘dental plaque’ the author speaks of the ‘coating of germs on the teeth.’ Such simple language does not weaken the message. The message is stronger because everyone understands.

The author has said:

I am sure some dentists will disagree with parts of this book. Some points of disagreement may be small, like the failure to use accepted dental terminology. Other ideas, particularly the suggestion that non-dental people can be trained to provide many kinds of treatments, may make some dentists angry.

The book is meant to be a source for argument and discussion. This way, it may stimulate others to write the kind of manual that is really needed in their countries.

We hope that this will be only the first volume of Where There Is No Dentist. It takes the reader as far as simple extraction (pulling) of teeth and placement of temporary fillings. As we have seen, village workers can also learn a wide range of more difficult dental skills. We hope that later volumes of Where There Is No Dentist will include permanent fillings, homemade portable drilling equipment (many kinds have been developed), the making of false teeth, and root canal treatment. There is no reason why village workers cannot learn all of these skills and practice them at low cost to serve the millions who are unserved today.

The people must answer to the people’s needs. The health of teeth and gums, along with general health, will improve only when people take the lead in caring for themselves. The challenge for dentists and other health professionals is to allow and encourage this to happen.
Your Own Teeth and Gums

Next time you look in a mirror, look at your teeth and the skin (gums) around them. Look in your children's mouths, too. Look at both gums and teeth, because the health of one often depends on the health of the other. To be strong, teeth need healthy gums. Healthy gums need clean teeth.

What can good teeth give you?

- GOOD HEALTH
- GOOD LOOKS
- GOOD SPEECH
- GOOD EATING
- GOOD BREATH

And when you think of your teeth, think of your gums. Gums are important for holding each tooth in place.

You need strong teeth to eat different kinds of foods. Different foods are important for health. Nuts, maize, fruits, and meat are some of the best foods—but they are difficult to bite and chew if your teeth are loose and hurting!
You can usually tell if your teeth and gums are healthy or not. Look at the pictures on pages 71 and 72 and compare them with your own mouth. If you find a problem in your mouth, look for its name in Chapter 6 and look for its treatment in Chapter 7.

Most important: when you are not sure of a problem or how to treat it, talk to an experienced dental worker.

If you notice a problem early, often you can stop it from getting worse. It is even better to prevent the problem from starting. You can do this if you know how to keep your teeth and gums healthy.

Learn to take care of your own teeth and gums before you try to teach others. A good example is one of your best teaching tools. People will see that you are healthy, and they will want to know why. When you tell people ways to care for their teeth, they will believe you if they know that you do these things yourself. First take care of your own teeth and gums. Then teach your family what you have learned. They, too, will be good examples for others to see.
EAT ONLY GOOD HEALTHY FOODS

The best food is food that you grow or raise yourself. Mix different kinds of food together and eat several times a day. This helps your body as well as your teeth and gums to stay strong and healthy. Traditional food is usually good food.

Sweet food, especially the kind you buy from the store, can mix with germs and make cavities—holes in the teeth. Soft food sticks to the teeth easily and it, too, can make a coating of germs and food on the teeth that starts an infection in the gums—gum disease.

Soft and sweet food and drinks with a lot of sugar are bad for both teeth and gums.

Breast feed to help a child’s teeth grow and stay strong. An older child can drink from a cup.

Do not give a baby anything to drink from a bottle. Sweet tea, sugar water or fruit juice can easily make holes in the child’s teeth.

REMEMBER: BREAST IS BEST!

YES GOOD FOR TEETH

NO BAD FOR TEETH

Even milk has sugar that can wash over the baby’s teeth and cause cavities when it comes from a bottle.
CLEAN YOUR TEETH EVERY DAY

If you do not clean properly, the food that is left on your teeth can hurt the teeth as well as the gums near them.

HIDING PLACES

Bits of food stay longer in grooves and ‘hiding places’. This is where both tooth and gum problems start.

To prevent problems you must take special care to keep these protected places clean.

It is better to clean your teeth carefully once every day than to clean poorly many times a day.

Here are 3 places where problems start.

Use a soft brush to clean your teeth. Buy one from the store (be sure it says soft on the package), or make a brush yourself. To make a brush:

1. Use a small branch, young bamboo, strong grass or the skin from sugar cane or betel nut.

2. Cut a piece that is still green and soft.

3. Chew one end to make it stringy like a brush.

4. Sharpen the other end so it can clean between the teeth (see pages 69-70).
You can twist the fiber from inside a coconut husk into a kind of brush. First rub it and shake away the loose bits. Then use the end to clean your teeth.

Whatever kind of brush you use, be sure to clean your back teeth as well as your front teeth. Scrub the tops and sides where the grooves are. Then push the hairs between the teeth and scrub (page 67).

**Toothpaste is not necessary.** Charcoal or even just water is enough. When your teeth are clean, rinse away the loose pieces of food.
CAVITIES, TOOTHACHES AND ABSCESSES

‘Cavities’ are holes in teeth. Cavities are made by the infection called 

tooth decay. If you have a black spot on your tooth, it might be a cavity. If 
that tooth hurts some of the time, such as when you eat, drink, or 
breathe cold air, it probably has a cavity in it.

You will get cavities in your teeth if you eat sweet food and then do 
not clean your teeth. If you see a cavity starting in your mouth or feel a 
tooth hurting you, get help right away. A dental worker knows how to 
fill the cavity so you can keep that tooth. Do this before the pain gets 
worse.

If you do not fill a cavity, it grows bigger. It also grows deeper.

When decay touches the nerve inside, the tooth aches, even when you try 
to sleep.

When infection reaches the inside of a tooth, it is called a tooth 
abscess.

A tooth with an abscess needs treatment at once, before the infection 
can go into the bone (page 87). In most cases the tooth must be taken out. 
If it is not possible to do this right away, you can stop the problem from 
getting any worse if you follow these steps:

1. Wash the inside of your mouth with warm water. This removes any bits of food 
caught inside the cavity.
2. Take aspirin for pain. See page 88 for amount.
3. Reduce the swelling:
   - hold warm water inside your mouth near the bad tooth.
   - Wet a cloth with hot water and hold it against your face. Do not use water hot 
   enough to burn yourself!

A tooth abscess can cause swelling like this.
SORE BLEEDING GUMS

Healthy gums fit tightly around the teeth. Gums are infected if they are loose, sore, and red, and if they bleed when the teeth are cleaned. Infection in the gums is called gum disease.

Gum disease, like tooth decay, happens when acid touches the teeth and gums. This acid is made when sweet and soft foods mix with germs (see page 48).

Infection from gum disease can spread into the root fibers and bone (see page 40). But you can stop gum disease and prevent it from coming back. There are two things to do: clean your teeth better and strengthen your gums.

1. Even if your gums are sore and they bleed, you must still clean the teeth beside them. If more food collects on the teeth, the gum infection will get even worse. Get a soft brush (see p. 4) and use it gently. This way you will not hurt the gums when you clean.

2. To make your gums stronger and more able to fight the infection:
   - Eat more fresh fruits and green leafy vegetables, and fewer soft sticky foods from the store.
   - Rinse your mouth with warm salt water. Do this every day, even after your gums feel better.

(1) Mix some salt with a cup of warm water. (2) Take a mouthful and rinse. (3) Spit it out. Repeat until all of the salt water is finished.
MORE SERIOUS GUM DISEASE

Painful gums that bleed at the slightest touch need special treatment. If you have this problem, ask for help. A dental worker can explain what is happening and what needs to be done. A dental worker can also scrape the teeth and remove the tartar that is poking the gums, making them sore.

At home, you can do some things to help.
1. Clean your teeth near the gums with a soft brush. Gently push the brush between the tooth and the gum. It may bleed at first, but as the gums toughen, the bleeding will stop.
2. Make your food soft, so it is easier to chew. Pounded yam and soup are good examples.
3. Eat plenty of fresh fruits and vegetables. If it is difficult for you to bite into fruit, squeeze it and drink the juice.
4. Start rinsing your mouth with a mixture of hydrogen peroxide and water. You can get hydrogen peroxide from your clinic or your pharmacy (chemist).

The strength of hydrogen peroxide is important. Ask for a 3% solution, and mix it evenly with water—that is, 1/2 cup of hydrogen peroxide with 1/2 cup of water.

**WARNING:** Read the label to be sure the solution is 3%. A mixture with more than 3% hydrogen peroxide can burn the mouth.

Take some into your mouth and hold it there for about 2 minutes. Then spit it out and repeat. Do this every hour you are awake.

Use hydrogen peroxide for only 3 days. Then change and start rinsing with salt water (page 7).

If you take care, you can keep your teeth for a lifetime.
Old people can remember when there were fewer problems with teeth and gums. Children's teeth were stronger and adults kept their teeth longer.

Times are changing. Today there are more tooth and gum problems than ever before. In many countries, tooth decay and gum disease are two of the fastest growing health problems.

This unhealthy situation is getting worse, for two reasons: changes in the kind of food people now are eating, and not enough cleaning after they eat.

BEFORE, the food people ate was their own, grown and prepared by themselves.

NOW, more people are buying softer and sweeter food from the store. This kind of food sticks to the teeth more easily so it has more time to attack the teeth and gums.

Even sugar cane was not as bad as the sticky candy children eat today. The sugar was bad for the teeth, but the fiber in the cane helped rub them clean.

Everyone must be more careful to clean away soft, sweet food. But many people do not know how. Some, especially children, do not even try.
Many people do not understand that tooth and gum problems are caused by certain kinds of food, and poor cleaning of the teeth. In fact, some have a completely different belief.

Do not attack a belief because it is traditional. Many traditions are more healthy than 'modern' things. Often, instead of telling people that their belief is wrong, you can remind them of a different tradition that is healthy.

Help your family and friends to recognize their healthy traditions. Then help them find new ways to use these same traditions for better health.

OUR PEOPLE DO NOT USE TOOTHBRAVES. WE DO NOT HAVE MONEY TO BUY SUCH THINGS AT THE STORE.

BUT WE CAN MAKE FOR OURSELVES MANY OF THE THINGS THE STORE SELLS.

YES, AND WE CAN MAKE OUR OWN TOOTHBRAVES FROM THE TWIG OF A TREE!
BE A GOOD EXAMPLE

Other people like to watch what you do before they try something different. First show members of your family and then they will be an example to others in your community. For example:

1. Instead of buying all your foods from the store, buy fresh fruits and vegetables from the market. It is even better to grow food in your own garden.

   Learn to use several different kinds of foods in each meal. Mixing foods is a healthy idea. Invite friends to share your meals and see the number of different foods you have at each meal.

2. Do not buy fizzy drinks like Coca-Cola or Fanta. They have a lot of added sugar which quickly makes children's teeth rotten.

   Also, do not sweeten your child’s milk or tea.

   When she is young she can learn to enjoy drinks that are not sweet.

   Clean, cool water, tea with little sugar, milk, or water from a young coconut are best to drink. Fresh fruits are delicious when you are thirsty.

   Most important: do not give your child a feeding bottle, especially one with a sweet drink inside. (See page 3.)

3. Keep your children’s teeth clean. Your friends will notice clean teeth or teeth that are dirty or have cavities. Remember, clean teeth are healthy teeth.

   An older child can clean his own teeth if you show him how.

   A younger child cannot. He needs help. Each day someone older should clean his teeth for him (page 16).
When you teach, remember that as others learn, they too become teachers. Each person can teach another.

Encourage people to pass along what you have taught. Mothers can teach family and friends. Students can talk at home with brothers, sisters, and older family members.

If all learners become teachers, a simple message can begin in the health clinic or school and reach many more people at home.
FINDING THE BEST WAY TO TEACH

Deciding what to teach is important, but just as important is how to teach.

Learning cannot take place when you use words that people do not understand. They will learn something only when they see how it is related to their lives.

Remember this when you teach about eating good food and keeping teeth clean. Design your own health messages, but be ready to change them if people are not understanding or accepting what you say.

Here are five suggestions for teaching well.

1. Learn First From the People

Get involved in your community’s activities. Learn about people’s problems, and then offer to help solve them. People will listen to you when they know that you care about them and want to help.

Sit and talk with people. Learn about their customs, traditions and beliefs. Respect them.

Learn about their health habits. Improving health may require changing some habits and strengthening others.

Learn also about tooth decay and gum disease in your community.

Make people smile—then look into their mouths.

Find out how many children and adults are having problems with their teeth and gums. Do a survey such as the one on p. 176.
2. Build New Ideas Onto Old Ones

People find their own ways to stay healthy. Many traditions are good, helpful, and worth keeping. But some are not.

When you teach, start with what people already understand and are doing themselves. Then add new ideas.

This method of teaching is called ‘association of ideas’. It helps people to understand new ideas because they can compare them with what they already are doing.

In this way people can more easily accept, remember, and do what you suggest.

---

**A HEALTHY TRADITION builds NEW IDEAS AND WAYS**

Just as sweeping the compound makes it a clean and healthy place to live, brushing the teeth and gums keeps them clean and healthy.

A small child cannot find his own lice. Mother knows she must help him. A small child cannot see the food on his teeth. He needs help with that also.

Different vegetables when planted together—like maize and yams—help each other to grow. Eating different kinds of food helps people to grow. Eating them several times a day makes your teeth and gums, as well as your whole body, grow stronger.
3. Keep Your Messages Short and Simple

Instead of partially teaching too many things, it is better to discuss a few things well. After learning what health problems the people feel are greatest, decide what information will help them solve these problems. Then think of how to share the information. Try to:

- **Use simple words** (see page 13). If you must use a big word, take the time to explain it.

- **Teach people when they are ready to learn.** A sick person, for example, usually wants to know how to prevent his sickness from returning. He will remember what you tell him.

- **Repeat the most important message many times.** Whenever you teach about staying healthy, remember to emphasize eating good food and keeping teeth clean. Repetition helps people remember.

- **Let people see what you mean.** See pages 24 to 32 for ways to use pictures, puppets, and plays.

4. Teach Wherever People Get Together

Knowing where to teach is sometimes as important as how you teach. Instead of asking people to come to a class you have organized, go to them. Look for ways to fit into their way of living. You both will gain from the experience. They will ask more questions, and you will learn how to work with people to solve problems.

Talk with people where they gather near their homes.

Talk to women at health clinics, in the market, and at their church meetings.

Talk to men as they sit together and discuss important issues. Also go to their business and farming meetings.

Teach men and women at reading groups.
5. Teach Something People Can Do Right Away

It is good to tell a mother to keep her child’s teeth clean, but it is better to show her how to do it. She will remember how if she actually watches you clean her child’s teeth.

An even better way for a mother to learn is to let her clean her child’s teeth while you watch. A person discovers something for herself when she does it herself.

Pick out a child and clean his teeth yourself. Let his mother watch.

Use a soft brush (or for a baby, a clean cloth). Gently but quickly brush or wipe his teeth. Do the best you can even if he cries.

If mothers make this into a habit, the child will expect to have his teeth cleaned and will soon cooperate—just the way he does to have lice removed from his hair.

Now let each mother clean her own child’s teeth. Teach her to clean on top and on both sides of every tooth.

Ask her to do the same at home each day. At the next clinic, look at the children’s teeth and see how well the mothers are doing. Give further help when needed. Always praise and encourage those who are doing well.
Teaching Children
At School

Children want to learn. They want to know more about things that are real to them. Family, friends, and teachers are all important sources of new knowledge for the children.

It is important to keep alive their desire to learn, so that children can continue to ask questions, discover, and learn more for themselves.

When children are interested in something, they will work hard to learn all they can about it.

If you relate your teaching to children's interests and needs, they will learn more easily. New information added to what they already know helps children to understand your lesson better. As a result, they will want to learn more because the information is both interesting and worthwhile.

Teaching about teeth and gums is important. You must do it well if you want children to pay attention, learn, and finally act to take care of their own teeth and gums.

As school children continue to learn, they can share their new ideas and information at home with brothers, sisters, mothers, fathers, and grandparents. In this way, the circle of teaching and learning described on page 12 comes back into the family and is complete.

This chapter has two parts. Part 1 gives seven guidelines for assuring that learning takes place. Part 2 suggests ways to have fun while learning—with stories, games, and pictures. In Chapter 4 there are nine questions on teeth and gums with specific activities for learning how to answer them.
More children than ever before are having problems with their teeth and their gums. A tooth that hurts or gums that are sore can affect a student's ability to pay attention in school and learn.

Treating the problem makes the child feel better, and that is important. It is equally important to prevent the same problem from returning later.

Working together, teachers and school children can do much to prevent both tooth decay and gum disease.

Keeping the mouth healthy involves learning about eating good food and keeping teeth clean. Just giving information is not enough, though. To truly learn, children need a chance to find out things for themselves.

Forcing a person simply to accept what you say does not work very well. A student learns not to question. What you teach may have no relation to his own experiences and needs.

As a result, he may end up not doing what you teach—not eating good foods, and not cleaning his teeth.

Learning happens when a student with a question or an idea is able to discover more about it himself.

It also happens when he has a chance to do whatever is necessary to take better care of himself and his family.

He can learn by doing. Give him a chance to eat good food and clean his teeth at school.
Learning about teeth and gums can be fun. When the teaching is real and practical, students love to learn. Here are some ideas:

**Teaching so that learning can take place**
1. Teach and learn together with your school children.
2. Start with what the students already know.
3. Let students see and then do.
4. Let children help each other.
5. Teach about teeth and gums together with other subjects.
6. Be a good example.
7. Make the community part of your classroom.

1. Teach and Learn Together with School Children.

A discussion draws out information and opinions.

It helps you to learn more about the school children, what they already know and believe to be true.

But it also allows you to introduce important information that is related to the discussion.

Share ideas instead of always giving information. Children learn more when they are involved. A lecture transfers your own notes to the children's notebooks without ever passing through their minds.
2. Start with What the Students Already Know.

To have meaning, learning should be a part of daily living. Talk with your students. Find out what they know about teeth and gums, and what questions they might have.

Add information by building upon what a person already knows.

Do not use big words. Scientific names and textbook explanations are confusing, and you usually do not need them. Talk about teeth and gums using words that a school child can understand and use later at home.

This way makes students feel stupid.

This way lets the students feel good, because it makes sense and they know something about it.

When you can understand new information, you gain confidence and you look forward to learning more.
3. Let Students See and Do.

Students learn best when they can take part and find out for themselves about something new.

AN OLD CHINESE SAYING:

IF I HEAR IT, I FORGET IT.

YOU CAN MAKE A TOOTHBRUSH USING A SMALL TWIG.

IF I SEE IT, I REMEMBER IT.

MAKE IT LIKE THIS.

IF I DO IT, I KNOW IT.

NOW, CHEW ONE END TO MAKE IT SOFT AND STRINGY.

A lecture about brushing teeth is usually not interesting at all.

Learning is more interesting when students can see how to make a brush and how to clean teeth properly.

If students can actually make their own brushes and clean their own teeth, it is not only interesting but fun.

A student who takes part will not forget. What he learns by doing becomes part of himself.
4. Let Children Help Each Other.*

In most families, older children have important work to do—taking care of their younger brothers and sisters. These older children can do much to teach the younger ones about care of teeth and gums. For example:

(1) When they feed their younger brothers and sisters they can encourage them to eat good food, like fruit instead of candy.

(2) They can do a play or puppet show about care of teeth and gums.

(3) They can check the teeth and gums of the younger children and ‘score’ them on how healthy they are (see p. 58).

(4) Best of all, they can actually clean the teeth of the younger ones, and show them how to clean their own teeth when they are able.

5. Teach About Teeth and Gums Together with Other Subjects.

Teeth and gums are part of a bigger health picture. Teach about them in class at the same time.

**Eating good food** can be part of a discussion on nutrition, teeth, farming methods, and the politics of who owns the lands.

**Cleaning the teeth** can be part of a discussion on hygiene, clean water, and traditions and customs.

A good way for school children to learn about using numbers is to do a survey in the community.

The results will tell the children something about health problems in their community. For an example of a survey of health problems, see page 3-14 of *Helping Health Workers Learn.*

*For more ideas on how school children can help each other, write to CHILD-to-child Program, Institute of Child Health, 30 Guilford Street, London WC1N 1EH, England.
6. Be a Good Example.

Children watch people around them. They pay attention to what you do, as well as to what you say.

Be a good example. **Take care to do yourself what you are teaching to your students.**

Your family can be a good example for others.

- Clean your teeth carefully every day. Also, help your children keep their teeth clean.
- Make a garden near your house and plant a variety of vegetables and fruits in it.
- Buy only good, healthy food from the store. Do not buy sweet foods and drinks for yourself or your children.

7. Make the Community Part of Your Classroom.

A child's home and his community are really more important to him than his school. Learning will be more interesting for a student if the day-to-day needs of his home and his community are part of school discussion.

Let students find out more about problems at home and in their community.

For example:

- How many small children have cavities or red, bleeding gums?
- How many stores have mostly sweet snack foods on their shelves?
- Why do the people not grow and eat more local food?

Back in the classroom, students can record what they find. Ask the children to think of ways to solve the problems they found. If they can think of a program to help solve a health problem, let them go back into their community and try it.
PART 2: MAKING LEARNING EXCITING, VISUAL, AND FUN

Here are some ideas to help students see what you are teaching, and to have fun while they learn. Students can also show these things to others. Teaching others is an excellent way to learn.

Tell a story about food or teeth. For example, tell a story about why a wild cat’s teeth are different in shape from a goat’s teeth (page 38). Stories are an excellent way to learn, both for the storyteller and for those listening. Leave time at the end to discuss the story and to introduce new information. See the example of storytelling on pages 177-179.

Make up a play or drama about good food or clean teeth. Show it later to the community.

The play should be about looking for an answer to a real problem. If the children invent the play, they will have to think, plan, and solve problems. A play also helps children learn how to talk with and teach others.

These school children in Nicaragua are doing a play about cavities. On the left, germs and sweet food are combining and trying to make a hole in the ‘tooth’. But a giant toothbrush (right) beats them away!

Do a demonstration using local resources.

Try, for example, the ‘tooth in the Coca-Cola’ test on page 46.
Puzzles can help school children discover answers for themselves. You can make your own. The best puzzles are with words that the students know and can use easily.

EXAMPLE (for younger children just learning to read)
Try to find these words:

As you find each word, put a ✓ beside it.

An older child can try to find important words that are more difficult.

VILLAGE CO-OP STORE

abscess	
toothache
cavity	

✓
sugar

✓
sore

infection
gum disease

Spell some of the words diagonally (slanted). It will make the puzzle harder.
You can use pictures on posters, flip charts, and on flannel-boards.

Pictures that school children draw themselves are best. They learn simply by drawing them. Also, school children will draw local people and local experiences, and the people will understand their pictures better than the ones sent from a central office far away.

Photographs of local people and events are also good. If there is a photography club in a local secondary school, have them take some pictures for you. They may even print the photographs larger so that you can use them as posters.

Ask the children to make pictures big enough so that a person can stand far away and see them easily.

Let each child carry her poster home to show her family and friends.

Hang up other posters in the store, church, or other places where people will see them.

Pictures can be made to stick to cloth and then used to tell a story. Cover a board with a piece of flannel cloth or a soft blanket, to make a flannel-board.*

Mix some flour and water to make glue. Then glue a strip of sandpaper to the back of each picture. The sandpaper sticks to the cloth and lets you place the picture where you want on the cloth.

Let the child use her pictures and cloth outside of the school, to show her story to family and friends.

*For more ideas on flannel-boards, see pages 11-15 to 11-19 of Helping Health Workers Learn.
Flip charts are excellent for telling a story with pictures. Often, people can guess what the story is about just from the pictures. When showing the pictures on a flip chart, ask as many questions as you can, to get the people to tell you the story.

Here a health worker from Mozambique is holding a flip chart with pictures about care of teeth and gums. There are no words with the pictures.

But he can read a short message written on the back of the page before. There are also examples of questions to ask. This way, anyone who can read can tell the ‘flip chart story’ to others.

There is also a small copy of the big picture on the back of the page before.

This is part of a flip chart presentation on mothers’ and children’s health. Notice the rings at the top that hold the flip chart together. They are made from old electrical cords.

Find a way to attach the sheets of heavy paper. Here are two ways:

- with 2 thin pieces of wood
- with metal or wire rings
FLIP CHARTS—AN EXAMPLE

Dental workers in Mozambique created this flip chart presentation for teaching in schools.

1) Here is a healthy, happy schoolboy. In the circle you see the inside of his mouth. His teeth are white and clean. Look at his gums. What color are they? Are they tight or loose? Between the teeth, are the gums pointed or flat?

2) This is an unhappy, sick boy. What color are his teeth? Not only are they yellow, there are black spots. These are cavities.

What color are his gums? Are they pointed? Loose, red, swollen gums are signs of gum disease.

Both cavities and gum disease can be treated.

3) What happens if tooth and gum problems are not treated?

a) The black hole grows bigger on the tooth and a sore forms on the gums near the root. The tooth hurts whenever you touch it.

b) The red, loose gums pull away from the tooth. Infection gets to the bone and eats it. The tooth loses the bone and the gum around it.

The first problem is a tooth abscess. The second is advanced gum disease. If either of these things happens, the tooth must be taken out.

4) Why does the boy have cavities and gum disease? There are 2 reasons.

a) He eats too many sweet foods.

What foods do you see here?

What other foods hurt the teeth?

b) He does not clean his teeth regularly.

The germs in his mouth eat sugar from his food and make acid. Acid causes both cavities and gum disease.
5) What foods can the boy eat to keep his teeth and gums healthy? What do you see in this picture?

Natural foods, with no sugar added, are the best. The foods you grow yourself and local foods from the market are better than sweet foods from the store.

6) How can we clean our teeth? *Carefully* is the important word to remember. Clean your teeth at least once a day, carefully brushing every part of every tooth—outside, inside, and top. Be very careful to **push your brush between your teeth**. That is where the germs and food collect to make acid.

If you do not have a toothbrush, you can make one from a stick. Toothpaste is not necessary. Clean water is enough.

Chapter 12 in *Helping Health Workers Learn* is full of ideas on how to make and use pictures effectively. Once you have a good original, you do not need to be an artist to make a good copy. Here is an easy method that can involve every student.

Place thin see-through paper over the original drawing. Carefully trace a copy.

Now place the copy on a new sheet of heavy paper. Pressing firmly with a pencil, retrace all of the lines on the thin copy paper.

Remove the tracing paper. Pressure from the pencil has made lines on the poster paper. Redraw them with a pencil so they stand out clearly.

Your copy is now ready for coloring. And you can use your copy paper again to make another copy.
Use puppet shows to act out the messages of eating good food and keeping teeth clean.

Students can make their own puppets to look like people or animals.

Using puppets, it is often easier to say things that people themselves cannot. For example, they can talk openly about the bad food sold at the village store.

Children can make puppets easily from paper bags. They are good for showing teeth because you can make a wide-open mouth.

![Diagram of puppet making]

A puppet made from a sock looks alive.

1. Fit the sock over your hand.
2. Make the mouth by pushing in the cloth between your thumb and fingers.
3. Add eyes, nose and hair to the sock or to a box that fits over it.

Loosely fill a cloth bag with old cotton or paper. Put the end of a stick inside, and tie the bag to it with tape or string. Make a sad or happy face to fit the story. Dress the puppet with an old piece of cloth.
4) One day later.
(Note how the scene behind the puppets changes. It is a flipchart with pictures to show the different places the puppets 'go'.)

5) "I am a poor farmer," Pedro's father tells Maria. "I only go to the city two times a year to sell my crops. I cannot take the boy to the city and pay for fillings in his teeth."
Maria answers, "But we can save his teeth with a temporary cement filling."

6) "Then, when you have time and money, you can go to the city. I know a dental worker who will put in a permanent filling. I trust him. I will send a note with you, and it will not cost much."
"Good!" says the father.
"Come on, Pedro," says Maria, "I'll put some cement in those holes!"

7) Four months later, Pedro visits the dental worker in the city. "Maria's good fillings saved your teeth," he says. "These permanent fillings will last for years."
"Terrific!" says Pedro.

8) After the show, the puppets played a game. Throwing a ball into the audience, they asked questions like "How do you keep cavities from happening?" Each child who caught the ball answered the question and threw it back. Then the children in the audience began asking questions for the puppets to answer. "Why did you get rotten teeth?" one child asked Pedro. The puppet looked down and said, "Too much candy!"

*To learn how to make a temporary filling, see Chapter 10.
Above, school children in Ajoya, Mexico are holding puppets they made themselves. On the left, you see them in front of the stage and at right, the children show how they hold the puppets behind the stage.

1) They called their puppet show “Rotten Teeth—And A Friend’s Advice.”

2) Pedro, a schoolboy, is sad. His friends looked into his mouth and saw two teeth with big holes in them. He tells his brother he wants to walk home alone.

3) On the way, Pedro meets Maria, a friend who is a dental worker. “I’m not sad because the others are laughing,” says Pedro. “I know the real problem. The holes in my teeth will get bigger. My teeth will rot and fall out, and maybe my permanent teeth coming in will rot, too.”

Maria thinks she knows what to do. “We will talk to your father,” she says.

*For another example of a puppet show, and more suggestions for making puppets, see pages 27-35 to 27-39 of Helping Health Workers Learn.
School Activities for Learning About Teeth and Gums

We can help school children in two ways. First, they need treatment now for problems they already have. Second, they need to learn how to prevent problems from hurting them (and their families) later.

Treatment and prevention go together. It is a mistake to emphasize only prevention and to forget about treatment. In fact, early treatment is the first step to prevention because it usually meets a person's most strongly felt, immediate need.

As a community dental worker, you can visit a school and find out what the felt needs are. Begin with the teacher. Examine for cavities, bleeding gums, or other problems. Then look at the students.

Chapter 6 tells you how to examine a person. It also helps you decide what treatment to give, and who should give it.

Then teach how to prevent dental problems. Give the teacher ideas to help students learn why they have problems, and how to keep the problems from returning. The best way to learn is by doing—through activities, not lectures. This chapter has many suggestions for activities.

The best health practice is to prevent cavities and gum disease from even starting. With these activities, children can do something to guard their health.

Teacher, each day at school:

Suggest ways for your students to eat good healthy kinds of food.

AND

Give your students time to clean their teeth.

1. Eating only good healthy foods
2. Cleaning my teeth carefully every day.

How do you take care of your teeth?
A Note To Teachers:

Do not wait for a dental worker. This book, and especially this chapter, is written to help you learn and do things yourself. But do ask your dental worker to work with you. He probably has suggestions that would fit your situation. After examining the children, he can help you follow their progress. You can then find out how much they are learning and how healthy they are becoming.

To begin, talk with your students to find out what they think and what they already know. What are their traditional beliefs? Some may be helpful, and others may need changing. At first it is best simply to discuss.

Ask the kind of questions that get students talking. Later they will take part in discussions more easily.

Add new information as you go along, changing some ideas but usually building upon what the students already know.

This chapter asks nine questions:

1. Why do we need teeth and gums?
2. Why do some teeth look different?
3. What holds the teeth?
4. How often do teeth grow in?
5. What makes teeth hurt?
6. How do germs make holes in the teeth?
7. What makes the gums feel sore?
8. What does it mean if a tooth is loose?
9. How can we prevent cavities and sore gums?

For each question, there is an activity to help students discover answers for themselves. The questions are not in any particular order, nor are they written for any particular grade level. Make your own lesson plan, using the main idea to help you. Shorten the lesson and make it easier for younger children. Add more information for older students and let them do more activities.
Why Do We Need Teeth and Gums?

THE IDEA:

Your teeth and the gums around them help you in many ways.

**Teeth are important for:**

Good **Health.** Infection from a bad tooth can spread to other parts of your body.

Good **Looks.** Healthy teeth that look good help you feel good.

Good **Speech.** Your tongue and lips touching the teeth help you make many sounds.

Good **Eating.** Your teeth break food into small pieces so that you can swallow and digest it better.

Good **Breath.** If you leave food around your teeth, your breath will smell bad.

**Your gums are important too.**

They fit tightly around the teeth, and help to keep them strong. Without strong gums, your teeth are of no use. Most old people lose teeth because of bad gums, not bad teeth.

THE ACTIVITY:

1. Draw or cut pictures of people from magazines. Make posters to show that healthy teeth make a person happy, while bad teeth make a person sad. Use the posters for discussion.

   Hang up a picture of a person the students know and like. Put black on one of her front teeth. Talk about it.

   OR

   Leave the picture for a few days. Then put black on some of her teeth before the students come to school. See who notices first.

   When someone sees the difference, talk about how the person looks, how teeth can be lost, how to prevent that, and what she can do now.
Make a picture of a person who has lost all of his teeth. He looks old.
Talk about how hard it is for him to eat properly or speak clearly.

2. Have the students say words that use teeth to make sounds.

"v" and "f" — friend, fever — the lower lip touches the top teeth.
"th" — the, teeth — the tongue touches the top teeth.
"s" — sun — air goes between the teeth.
Now, try saying the same words again, but do not let the tongue or lips touch the teeth.

3. Have students draw pictures of good foods we use our teeth to eat. Then draw foods that we can eat if we lose our teeth.

<table>
<thead>
<tr>
<th>Need Teeth</th>
<th>No Teeth Needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Image of foods that need teeth]</td>
<td>![Image of foods that can be eaten without teeth]</td>
</tr>
<tr>
<td>And Many More!</td>
<td>But NOT Much More!</td>
</tr>
</tbody>
</table>

Talk about this together. Try to eat a mango or some maize without using your teeth, or using only your front teeth.
Why Do Some Teeth Look Different?

THE IDEA:

We need two different kinds of teeth to help us eat our food.

Front teeth. Another name for them is incisors. Their sharp edge cuts food into pieces.

Back teeth are called molars. They chew and grind pieces of food into bits small enough to swallow.

The outside of a tooth is the hardest and strongest part of your body. When a tooth is healthy, it can chew hard food, even bone. The shape of a tooth allows us to swallow food when the small pieces can slide down its smooth sides.

Small bits of food often get caught inside deep lines, or grooves, in a tooth. Look for them on the top and the sides of back teeth.

Food that is not cleaned away from the grooves can make a cavity (hole) in them. A tooth with a cavity is weak and often hurts.
THE ACTIVITY:

1. Ask the students to bring different kinds of food to class. Bring some yourself.

   Eat the food using first the front and then the back teeth.

   Bite a guava using only the back teeth.

   Chew completely a mango or piece of maize, using only the front teeth.

2. Collect teeth from different animals. Let the students discover from the shape of an animal's teeth the kind of food it usually eats. For instance, a wild cat needs sharp pointed teeth to tear meat, but a goat needs flat teeth to chew grass.

   Make a poster to show the animal, its teeth, and the kind of food it likes to eat.

3. Have each student take a partner. Let each look at the shape of the front and back teeth in the other's mouth.

   Talk about the many different kinds of food we need to stay healthy. Discuss which teeth we use to chew meat, fish, mango, and other good foods in your area. (For most foods, the answer is both front and back teeth!)
What Holds the Teeth?

**THE IDEA:**

When you look inside someone's mouth, you see only the top part of each tooth. The bottom part, its root, is inside the bone under the gum.

The roots of the tooth hold it in the bone just like the roots of a tree hold it firmly in the ground.

The roots of the tooth do not actually touch the bone. Root fibers connect the root and bone, holding the tooth in place.

The gums do not hold the teeth, but healthy gums will keep harmful germs from getting to the bone and root fibers. When the gums are not healthy, they form deep 'pockets' which collect germs. Soon, these germs will reach the root fibers and bone. The bone pulls away from the tooth in order to get away from the germs. With no bone to hold it, the tooth is lost. This is the most common reason why teeth fall out.

**THE ACTIVITY:**

1. Have the students look for an old jaw bone from a dog or other animal. Notice that bone goes around every root of every tooth and holds it tightly. Break away some of the bone and look at the roots of the teeth.

Front teeth need only one root because they are used for biting.

Back teeth have 2, 3, or even 4 roots. That makes them strong enough to chew tough meat and even break hard bone.
2. Show your students how infected gums can cause teeth to fall out.

A. When gum disease is beginning, a small red 'pocket' forms where the tooth meets the gum. Germs and food collect in the gum and make acid. This makes the gums sore. B. As a result, the gum pulls away and the pocket becomes deeper. C. The bone moves away from the infection and no longer holds the tooth.

Try to think of other ways to teach how gum disease pushes the bone away from the tooth. In Jamaica, dental workers ask, "What do you do if someone attacks you with a machete (long knife)?" "I run away!" most people answer. "Exactly," say the dental workers, "and when you have a lot of germs attacking the root of your tooth, the bone 'runs away' and leaves the tooth with nothing to hold it."

Tell a story to show how, when the gum moves away from the top of the tooth, the root and bone are open to attack. For example:

Enrique was sleeping on a cold night when suddenly he had diarrhea. Still dreaming, he went outside, and afterward, he forgot to close his pants tightly. Suddenly, he saw an ugly monster coming after him! He ran away without thinking of his pants. Finally he could not run because his pants were around his knees, and the monster caught him.

Explain to the children that when the gums are red near a tooth, they are like Enrique's pants—not tight enough around the tooth. When germs come near the tooth, they will go inside and the gums will 'fall down' and show part of the root of the tooth. When this happens, the germs attack not only the top of the tooth, but also the bone and root.
How Often Do Teeth Grow In?

THE IDEA:

A child gets two sets of teeth. The first set, baby teeth, starts to grow when the child is a baby. The second and last set grows in at school age. They are the permanent teeth. Permanent teeth should last a lifetime.

A child grows his first baby tooth at about 7 months of age. It is usually a front one.

A baby who is poorly nourished, however, may not grow his first tooth until later. Do not wait for the first tooth before giving him the extra soft food he needs to grow and stay healthy.

The remaining baby teeth grow in over the next 24 months. By the time the child is 30 months old, there will be a total of 20 baby teeth in his mouth, 10 on top and 10 on the bottom.

Most permanent teeth form under the baby teeth. When the child is between 6 and 12 years old, the permanent teeth push against the roots of the baby teeth, making them fall out. Not all of the baby teeth fall out at once. One tooth at a time becomes loose, falls out, and then is replaced with a permanent tooth. The new tooth may not grow in immediately. Sometimes 2 or 3 months pass before the new tooth grows into the space.

In the 6 years between ages 6 and 12, the 20 permanent teeth replace the 20 baby teeth. In addition, 8 other teeth grow in behind the baby teeth.

At 6 years the four 1st permanent molars start to grow in at the back of the mouth. This means an 8-year-old child should have 24 teeth, or spaces for them.

At 12 years, the four 2nd permanent molars grow in behind the 1st molars. This means a 14-year-old child should have 28 teeth, or spaces for them.

Between 16 and 22 years, the four 3rd permanent molars grow in. This means that an adult should have a total of 32 permanent teeth: 16 on top and 16 on the bottom.*

*(Note: the third molars often do not grow in correctly. This is a very common cause of tooth pain. See page 64.)
THE ACTIVITY:

Have the students examine each other.* Help them learn which are baby teeth and which are permanent teeth. Look for the important 1st permanent molars at the back.

Show the students how to count the teeth and the spaces that are ready for new teeth to grow in.

Then have them count their friends' teeth, to find out how many teeth should be growing in different age groups. Later, they can do this with their brothers and sisters at home.

- Wash your hands.
- Count the teeth.
- Count the spaces where new teeth have not yet grown in.

TOTAL = teeth + spaces

- Find out the person's age.

Have the students first write their totals on the blackboard. Then make a chart for the children to remember and discuss the results.

<table>
<thead>
<tr>
<th>Lesson: Number of Teeth We Should Have</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL = teeth now present (T) + spaces (S)</td>
</tr>
<tr>
<td>Under 6 years</td>
</tr>
<tr>
<td>Mita (girl)</td>
</tr>
<tr>
<td>Joseph (boy)</td>
</tr>
<tr>
<td>Saa (father)</td>
</tr>
<tr>
<td>Ambur (girl)</td>
</tr>
<tr>
<td>Michael (boy)</td>
</tr>
</tbody>
</table>

* Here the children are only counting the teeth. They can also learn to check for cavities and gum disease (see p. 47).
Discuss the number of teeth children have at different ages. Young children 6 to 12 years old, for example, have 24 teeth; older students, 28 teeth; and adults, 32 teeth.

At home, students can count brothers' and sisters' teeth to learn how many teeth small children have. Count only the teeth and not the spaces.

<table>

</tr>
</tbody>
</table>

Ask the students what other things they saw inside someone else's mouth. This is a good time for students to discover important things about good health practices. Encourage them to learn as much as they can from what they see, and then show them how to use a book like this to answer their own questions. For example, if students see cavities and red bleeding gums, you can start a discussion on tooth decay and gum disease. Use some of the activities on pages 53 to 58.

For another example, if the students see a baby who has only a few teeth, they may have some interesting questions. Show them this book and invite them to read pages 61 to 63 to find answers to questions like these:

- Can Chenia, who is six months old and has no teeth, eat soft foods? Should she have more than just breast milk?
- When Chenia's teeth grow in, will they give her diarrhea and fever?
- Will a 2-year-old girl get more baby teeth?
- Why do we care for baby teeth, when we only need them for a few years?
What Makes Teeth Hurt?

THE IDEA:

A tooth will hurt if it is broken, loose, or if it has a cavity. Cavities are the usual cause of toothaches.

Healthy teeth are alive.

Two thin strings enter each tooth. One, the nerve, comes from the brain and carries the message of pain. The other is the blood vessel. It comes from the heart and carries blood to the tooth.

If you could peel away the gum and look inside the bone, you would see that a nerve and a blood vessel go into each one of a tooth’s roots.

They give the tooth life and feeling.

The hard cover of the tooth protects the nerve and blood vessel inside it. But when tooth decay eats through that cover, the nerve and blood vessel are unprotected. A cavity lets food, water and air get closer to the nerve, and that can make the tooth hurt.

The sugar in food makes tooth decay possible. Sweet food that is also sticky is the worst of all because it glues itself to the teeth. Germs inside your mouth use the sugar to grow and to work harder at making cavities.

See the next section for more discussion of how germs and sugar combine to cause cavities.
A cavity may look small on the outside, but it is much bigger inside. Decay spreads more easily in the soft part under the hard cover of the tooth.

A tooth with a cavity may hurt, but it usually does not hurt all the time. This is because the bottom of the cavity is close, but not yet on the nerve inside the tooth.

Fill a small cavity and save a tooth.

A small cavity that is not treated grows bigger and gets deeper. When the cavity finally touches the nerve, it causes a tooth abscess. Infection from the tooth decay going inside the tooth causes the tooth to ache all the time, even when you try to sleep.

Infection can pass from the tooth to the bone. As it spreads under the skin, there will be swelling of your face.

A tooth with an abscess must either be taken out or have its nerve treated.

An abscessed tooth is dying. When it dies the tooth changes color from white to dark yellow, grey, or even black. Pus from the end of its root can pass to the gum, making a sore called a gum bubble.

A tooth is like a light bulb.

When the bulb is alive from power inside, it is bright and useful.

The little wires inside the bulb are like the nerves inside the tooth. When the bulb burns out, it is dark and not useful any more.
THE ACTIVITY:

1. Have each student look inside a partner’s mouth. Look for black spots that may be cavities, for dark teeth that are dead, and for sores on the gums, especially near a bad tooth.

2. Discover how sweet food sticks to teeth.

   Cut several different kinds of food with a knife.
   Vegetables and meat do not stick to the knife.
   Sweet foods, like chocolate and jam buns, do stick to the knife.
   They stick to your teeth the same way.

   Pour some cola or juice in a dish, and leave it outside overnight.
   As water is lost, the juice left in the dish becomes sticky. It attracts flies.
   The air you breathe dries the cola and causes a sticky, very sweet coating to form on your teeth. It attracts germs.

   Try to find some old teeth. Ask the students to keep their own baby teeth when they fall out. (Note: in some countries this is not acceptable.) Your dental worker can save you some teeth that were taken out at the clinic.

   Scrape the outer cover of the root with a knife. Feel how hard and smooth it is.

   Then find out what happens when the students leave a tooth in cola, milk, or plain water.

   After 3 days scrape each tooth again with a knife. Students will discover that sweet cola drinks make teeth softer and darker in color.
3. Look inside a tooth for the space where the nerve and blood vessel used to be. See how close they were to the tooth’s hard outer cover. Look for a small hole at the end of the root. That is the place where the nerve and blood vessel enter the tooth.

Ask your dental worker to find an old tooth with a cavity and grind it for you.

OR

1. Take a hammer.
2. Gently break open a tooth.
3. Look inside.

See how much bigger the cavity is on the inside. It spreads under the hard cover.

Cut through a rotten yam. See how the rotten part spreads under its skin in the same way.

4. Do a project in class.
   - Count the number of students with cavities.
   - Count the number of teeth having cavities. Show the students how to look for them on the tops, sides and between the teeth.
   - Find out the person’s age.

Have the students write on the blackboard what they counted. Then make a chart or graph.

- Decide if tooth decay is a serious problem in your school. Ask your dental worker to look at your results and to come and treat the students, and help you prevent the problem from returning.
- Do the same with brothers and sisters at home. Find out if tooth decay is a problem with these young children. Tell your dental worker what you find.
How Do Germs Make Holes in the Teeth?

THE IDEA:

*Acid* makes holes in the teeth. The acid is made when sweet foods mix with germs in your mouth.

It is not possible to prevent cavities or gum problems by trying to kill all of the germs in your mouth. There are too many—and some germs are good for you. The important thing is to keep the germs from getting together and making a film or coating on your teeth.

This film on the teeth is called *plaque*, but you do not need to use this word. Every morning we can all feel a 'furry film' on our teeth. This film must not be allowed to stay on the teeth! It will mix with sugar and make acid. Worse, if it stays in a group (or 'colony') for more than 24 hours, it will mix with saliva, harden, and make tartar (see page 50).

The main reason for cleaning teeth is to break up these colonies so they cannot make acid. Also, if you forget to clean your teeth, tartar will form, and you will need a dental worker to scrape it off. This is why it is important to clean your teeth at least every 24 hours, so the tartar can never form on your teeth.

THE ACTIVITY:

Here is a game called “Scatter!” that students can play outside.

You need:

- Five ‘bases’ (a tree, rock, or the corner of a house can be a base) in a half circle, 12 meters apart. Each base must have a ‘monitor’ who stays at the base. Note: children who cannot run can be good monitors.
- One person with a broom. This person is the ‘decolonizer’.

**The Game:**

20 students called ‘colonizers’ stand facing the decolonizer. When the decolonizer says “go!” they try to ‘form colonies’ around the bases before the decolonizer can touch them with the broom.
The colonizers win if they make a colony. There are two kinds of colony: (1) 15 people touching one monitor at a base, or (2) a chain of 12 people holding hands, touching two monitors.

Play two games: one with children trying to form the first kind of colony, one with the second kind. These photos are from the second game.

The colonizer tries to stop the others by touching them with the broom. When the colonizer touches a colonizer with the broom, the colonizer must leave the area for one minute. (Give that child a task to do—run around the schoolhouse or lie down and sit up 30 times.)

The colonizer wins if no colonies form in 5 minutes.

After The Game:

Talk to the students about germs in their mouths and how small they are. Can anyone see germs? No, but they can feel them and taste them. Ask the group what their mouths feel like in the morning when they wake up. You may get these answers:

- my teeth feel mossy!
- my breath is bad,
- I feel a coating on my teeth, but it goes away when I brush them.

Tell the students that this coating on the teeth is a ‘colony’ of germs. They are always trying to group together on the teeth or in spaces between the teeth—just as the ‘colonizers’ did in the game!
What Makes the Gums Feel Sore?

THE IDEA:

Healthy gums fit tightly around the teeth and help to hold them strongly. Healthy gums also cover and protect the bone under them.

**Healthy gums are pink in color**, or even blue or dark yellow in some people. But healthy gums are never red.

**Healthy gums are pointed between the teeth.** This lets food slide away and be swallowed.

**Healthy gums fold under, making a little pocket around the tooth.**

As we saw with the last activity (p. 48), when you have ‘colonies’ of germs on your teeth, they can make acid that makes holes on your teeth. The same coating of germs can make a different acid that makes the gums sore. This also happens when food mixes with the coating on your teeth. Soft food is the worst kind, because when it mixes with spit it sticks more and stays longer on your teeth. Juice from tea, betel nut, and meat color this food, making the tooth look dark.

Healthy gums become sore because of acid. Also, if the coating on the teeth (p. 48) becomes hard, it is called tartar. Tartar can be very sharp and hurt the gums. Also, the ‘colonies’ of germs can make a coating on top of tartar more easily than on a clean tooth. When the colonies are new, they make more acid to cause tooth and gum problems. After 24 hours, they harden and make a new layer of tartar. The tartar gets bigger and bigger.

**Sore gums are infected.**
**Infected gums are red and bleed easily.**

**Infected gums are round and swollen between the teeth.** They are also loose instead of tight against the teeth.

**Infected gums have a deep gum pocket** which catches even more food.
Infection in the gums is called **gum disease**. It is important to treat gum disease early, before it can spread to the root fibers and the bone.

If you have sore, bleeding gums, you can do much to treat the infection yourself.

1. Clean your teeth with a soft brush gently and more often. (see page 69)
2. Eat more fresh fruits and vegetables.
3. Rinse your mouth with warm salt water.
4. Clean between your teeth with dental floss or string. At first your gums may bleed when you do this. But when the gums are stronger the bleeding will stop.

**THE ACTIVITY:**

1. Have the students look in each other’s mouths. Can they see the coating on the teeth? Usually they cannot. They may see food or ‘white stuff’, but this is not the coating that makes acid. However, if someone has been chewing betel nut or eating berries, you will see stains on her teeth **and the stains will be darkest** where she has these colonies of germs on her teeth.

   Put something on the teeth to stain the colonies of germs. Try using food dye, betel nut or berry juices. Remember: first wash your hands! Older students can rub berries on the teeth of the younger ones. Have them rinse with a little water and spit it out. After this, the colored areas on the teeth will show where the colonies of germs are forming. Where are they? Usually you will see the dark colors:

   - between the teeth
   - in the pits or holes in the teeth
   - on the tops (biting surfaces) of the teeth.

   The older students can now show the younger ones the best way to clean teeth (see pages 67-70). Let the younger ones see in the mirror if they are getting the colored juice from their teeth. They will learn that it is most difficult to get rid of the color between their teeth. Give them some string, dental floss, or even the soft stem from a young palm leaf, and show them how to use it between their teeth (p. 70). Remind them to be gentle, or they will hurt their gums. **You should clean between your teeth every day.**
What Does It Mean if a Tooth is Loose?

The Idea:

Baby teeth become loose when children are between 6 and 12 years old. This is normal. If a loose baby tooth does not have a cavity, and if the gums around it are healthy, there is probably a permanent tooth growing under it.

But a tooth might be loose because it is broken or because it is sick from an abscess or gum disease. Either can destroy the bone around the tooth's roots.

When bone is lost, the tooth becomes loose. A loose tooth hurts and usually must be taken out.

There is no medicine to make bone grow back around the roots of loose teeth. All you can do is stop the infection from getting worse.

The Activity:

1. Let the students look into each other's mouth for loose baby teeth. Look carefully to see why a tooth is loose.

   Touch the gum and bone beside the loose tooth. You can feel a bump—it is the new permanent tooth growing.

   Save the baby tooth after it has fallen out. Look to see how the permanent tooth has eaten away its root by pushing against it.

2. Look for teeth that have cavities or gum disease around them. The students can do this with each other, and then later at home. (Remember they must wash their hands!)

   A tooth that has some of its root showing is probably loose.

   Using your fingers or the handles of two spoons, rock the tooth back and forth gently. See how much it moves, and ask how much it hurts.

   Tell the person what he can do to prevent other teeth from becoming loose. (See the next section.)
How Can We Prevent Cavities and Sore Gums?

Eating good food and carefully cleaning the teeth prevents both tooth decay and gum disease.

Food from your own garden and local food from the market is best. These foods are good for your body, your teeth, and your gums.

Vegetables, especially those with dark green leaves.

Fruits, like banana, guava, oranges, and papaya.

Peas and beans, like green beans, soybeans, winged beans, and mung beans.

Fish, meat and eggs.

Oil, from palm nut kernels, ground nuts, and coconut.

Clean water, coconut water, and milk are best to drink.

Soft foods and sweet foods from the store are not good for you. Soft foods stick to your teeth easily. They can work longer to cause cavities and infected gums. Sweet foods have mostly sugar in them, and it is ‘factory sugar’, not the ‘natural sugar’ that is in the foods in the pictures above.

This kind of sugar is quick to mix with germs and make acid. Remember: natural sugar makes acid slowly; factory sugar makes acid quickly.

Children who eat a lot of sugar lose their appetite for other foods—the foods that help them grow strong, stay healthy, and learn well in school.

Store foods are also expensive. You can usually get better food, and more of it for the same money, from your garden or in the market.
Cleaning your teeth carefully every day is another important way to take care of both teeth and gums. **However, cleaning teeth is like building a house. To do a good job, you need to work slowly and carefully.** Once a day is enough, if you clean your teeth well every day.

Buy a brush from the store, or make one yourself (see p. 4). But be sure the cleaning end of the brush is soft so that it won’t hurt the gums.

Use your brush to clean all the teeth, especially the back ones with the grooves. Back teeth are harder to reach and so it is easy not to clean them well enough. Cavities start from sweet food and germs left together inside the grooves.

1. Scrub the inside, outside, and top of each tooth.
2. Push the hairs of your brush between two teeth. Sweep the food away.
3. Wash your mouth with water, to remove any loose bits of food.

Small children are not able to clean their teeth carefully enough by themselves. They need help. Look at the pictures on the cover and p. 16 to see how you can do this. **Older children can care for younger brothers and sisters at home.**
THE ACTIVITY:

One of the best ways to teach is by example.

Students will believe what their teacher says if they know he eats good food and cleans his teeth.

The reverse is also true. Learning is harder when students know that their teacher does not do those things himself.

Students can be a good example for their community, too. They can:

- draw pictures of foods that are both good and bad for teeth. Use them to make posters and flannel-board stories.
- make puppets and plays to discuss ways people can become healthier.

There are some other ways to make learning meaningful and fun.

1. Make a garden at school. Divide the ground so that each class has its own space to plant a garden.

   Use some of the garden’s food to prepare a meal for the students, perhaps once a week. Students can bring food from home if there is not enough ready in the garden.

2. Organize a school lunch program. Each day the students can bring some good food from home. Cooked yams, or maize, nuts, fruit and fresh vegetables are all good. Often the students will exchange food and talk about the many different foods that can be grown locally.
3. **Find the best way to clean teeth.** Divide the class into groups. They will learn more easily in a small group of 4 to 8 students.

Give all the students something to eat that is sweet, sticky and dark in color, such as sweet chocolate biscuits. Ask the students to look in each other's mouth, to see how easily the biscuit sticks to the teeth. One or two of the students in a group can then try to clean away the pieces of biscuit, using a different method.

When they are finished, the students can look at the teeth to decide if they are clean or not. Put your findings on a chart and talk about what you have learned.
4. Make cleaning part of a daily health activity.

Older students can look after younger students. They can first check their hair for lice, then sores for infection, and teeth for old food or germs. (To see the coating of germs on the teeth, try the activity on page 51.) One partner can point out to the other where washing and brushing can be done better.

CLEANLINESS CAN BEGIN AT SCHOOL

At school, students can wash their hands before lunch and brush their teeth afterward. Encourage them to keep a piece of soap and a toothbrush or brushstick (p. 4). One day a week, the whole class can rinse with fluoride water (p. 167) to prevent cavities.

A piece of bamboo can hold a brush nicely. Make two holes near the top for some grass string, to hang the bamboo brush holder.

Let each student look after her own soap and brush.
Have the students score each other’s progress. Do not make it hard to judge, or they will not do it. In the example below, the tooth is either clean or not clean.

SCORING TEETH

Pick 4 teeth, a back tooth and a front tooth—two on top and two on the bottom.

Use the same 4 teeth for each person. Look for food on each tooth near the gums.

A clean tooth = 2 points
A dirty tooth = 0 point
Total possible points each day is 4 teeth x 2 = 8 points.

In this example the score is:
Tooth 1 = 2 points
Tooth 2 = 0 point
Tooth 3 = 0 point
Tooth 4 = 2 points
Total = 4 points

Have each student put his daily score on a chart. At the end of the month he can see how much he has improved.

Have the students score each other’s progress. Do not make it hard to judge, or they will not do it. In the example below, the tooth is either clean or not clean.
We can prevent most tooth and gum problems. This chapter gives more information about how teeth grow in and how to keep teeth and gums healthy. Share this information and you will prevent problems from starting.

But remember that people are most interested in the problems they have now. Before listening to what you know about prevention, people will want treatment for the problems that are already causing them pain and discomfort.

Early treatment is a form of prevention. It can prevent a tooth or gum problem from becoming more serious.

When you treat a person’s problem, it shows that you care about him. It also shows that you know what treatment he needs. As his confidence in you grows, he will want to learn from you about preventing tooth or gum problems.

In order to help a person it is important to know what the problem is and what is the best treatment. But just as important is knowing what you are not able to do, and when to seek help.

In this chapter, you will learn more about teeth, gums, and problems affecting them, but you must never be too proud to get help from more experienced dental workers.
TAKING CARE OF BABY TEETH

A child's baby teeth are being made before birth while the baby is still inside the mother's womb. During the last months of pregnancy and the first few months after the child is born, the baby teeth take their final form. Pregnant mothers and young children need good food and good health in order to have strong baby teeth.

Strong teeth
are white and their front surface is smooth.

Weak teeth
have yellow marks that are pitted and rough.

Baby teeth get marks on them when: 1) the pregnant mother is sick or does not eat good food; 2) the young baby is sick or does not eat good food; or, sometimes, 3) the baby's birth was early or the delivery was difficult.

The marks are rougher than the rest of the tooth. Food sticks easily to them and turns the tooth yellow.

The marks are also soft. They need to be cleaned well every day (p. 61) to prevent them from becoming cavities. A tooth with a cavity hurts. When children's teeth hurt, they do not want to eat as much.

Cavities in baby teeth can make a child's malnutrition worse. Remember this whenever you see a weak, poorly nourished child. When you examine a child at the health clinic, lift his lip and look at his teeth. Do this as part of your routine examination.

You can fill cavities with cement (Chapter 10). Cement prevents food and air from going inside the cavity and hurting the child.

A sore on the gums may be a gum bubble. If so, it means the tooth has an abscess (page 78). That cavity should not be filled with cement. Instead, the tooth needs to be taken out (Chapter 11) before the infection can get worse.
For baby teeth to grow strong, mother and baby must stay healthy.* Help her to understand how important this is. A pregnant mother should:

1. Eat enough good kinds of foods, both for herself and her baby growing inside (page 66; also see *Where There Is No Doctor*, Chapter 11, and *Helping Health Workers Learn*, pages 25-39 to 25-44.)

2. Attend health clinic each month, so the health workers can examine her regularly and she can receive important medicines (see *Where There Is No Doctor*, page 250).

3. Not use the medicine tetracycline, because it can cause the teeth to turn dark. You, the health worker, must remember—do not give tetracycline to a pregnant woman or to a young child. If she needs an antibiotic, use a different one.

For baby teeth to stay strong, and to prevent marks from turning into cavities, mother should:

1. Continue to breastfeed and never feed her child juice or sweet tea from a bottle. Start adding soft foods, mashed banana or papaya when the child is 4 months old.

2. Wipe her baby's teeth with a clean cloth after the baby eats. This cleans the baby's teeth, and helps the baby get used to teeth cleaning. Later he will be happy with a brush.

Around 1 year of age, there will be several baby teeth. At that time, mother should start using water—not toothpaste—on a soft brush or brushstick. (With toothpaste, you cannot see the child's teeth clearly because of the bubbles it makes.) She should scrub the sides and tops of each baby tooth as well as she can (page 67).

The child can also try to clean his own teeth. That should be encouraged. However, since he is too young to clean properly, mother (or father, or older brother, or sister) must clean his teeth once a day for him. Continue helping in this way until the child is old enough to go to school.

You can make a large brush smaller, to fit more easily into a young child's mouth.

Pull out some of the back hairs, or cut them with scissors.

*See the story about pregnancy and dental care on pages 177-179.
Why Baby Teeth Are Important

Baby teeth are just as important to children as permanent teeth are to adults. They help a child to eat, talk, and look good.

However, many people feel that it is not worth the effort to look after baby teeth. Nor is it worth fixing them. After all, parents think, the permanent teeth will take their place.

This kind of thinking is understandable. The problem is that we are forgetting one other useful purpose of baby teeth. **Baby teeth keep space in the mouth for the permanent teeth to grow in.** If there is not enough space, the new teeth will grow in crooked, and cavities grow faster around crooked teeth.

Under each baby tooth a new permanent tooth is growing.

At the same time, extra permanent molars are forming at the back of the mouth, inside the bone (page 41).

Front baby teeth become loose and fall out (usually 6-7 years, but sometimes as young as 5 years) ahead of back baby teeth (10-12 years). This is because the front permanent teeth are formed and ready to grow in first.

The permanent molar (1PM) is often the first of the permanent teeth to grow into the mouth. That happens at 6 years of age.

The first permanent molar grows into the mouth by sliding against the back of the second baby molar (2BM). Slowly but steadily the upper and lower permanent molars grow until they meet and fit tightly together.
Between the ages of 6 and 11, a child needs healthy baby molars to guide the first permanent molars into position and then to hold them there. When the first permanent molars grow into the right place, this is a good sign. It means the other permanent teeth will also grow in properly, because they will have enough space.

**Note:** Some people are born without enough space. But most people are not born with this problem—they lose the spaces when they remove baby teeth instead of fixing them.

**HEALTHY BABY TEETH** —— to make **STRAIGHT PERMANENT TEETH**

**SICK BABY TEETH** —— to make **CROOKED PERMANENT TEETH**

Tell mothers why baby teeth are important. Good food and regular cleaning keeps them healthy. They should know that new teeth coming in do not cause diarrhea and fever, but that a child may have diarrhea or fever at the same time.

If there is a cavity, fix it so the tooth can be kept in the mouth to do its important work (see Chapter 10).
TAKING CARE OF MOLAR TEETH

We often notice front teeth growing in, but not the back ones. Back teeth—molars—are not so obvious. **Swelling on the face** can be either a new molar growing in or an abscess. So, to help you to decide, look at the tooth for a cavity and at the gums beside it for a gum bubble.

![Diagram showing cavity and gum bubble](image)

When you see a swollen face, look for the two signs of an abscess.

But if the person is young (16-22 years), it often is not an abscess. The third permanent molar tooth may be growing in at the back of her mouth. As the tooth grows, it cuts through the skin. Just as a dirty cut on a person’s hand can get infected, the cut gum around her new tooth also can get infected, causing a swollen face.

![Diagram showing cavity and gum bubble](image)

Look behind her back teeth. See the red swollen skin on top of the new tooth.

If there is enough space for the tooth, it will grow in by itself. It only needs time. Before acting, decide how serious the problem is.

If there is no swelling and she can open her mouth, explain to her what is happening and what she can do herself to reduce infection and toughen the gums. The best medicine is to rinse warm salt water over the sore area. A good home remedy is to rinse until the tooth grows all the way into the mouth.

If it does appear serious (severe pain, swelling, not able to open the mouth), see page 88 for further treatment.
This book often repeats an important message: eat good food and clean your teeth. It is repeated because this is the most important thing you can learn from this book. Later chapters will discuss what to do when problems occur, but if you follow these two suggestions, you will almost never have problems with your teeth and gums. This is true because good food keeps your whole body healthy, including your teeth. Also, with no 'colonies' of germs (page 48) or harmful factory sugar (p. 53) on your teeth, your mouth cannot make the acids that cause both tooth and gum problems. So, remember:

1. Eat Good Food

An easy-to-remember rule is the same foods that are good for the body are good for the teeth. A healthy body is the best protection against infection.

Good nutrition (eating well) means two things:

One, eat a mixture of different kinds of foods every time you eat. Look at the pictures on page 53. There are several groups of foods. Every time you eat, try to eat one or two foods from each of the groups. This way, you will get three important kinds of food: GROW FOOD (body-building food) to give you the protein you need; GLOW FOOD (protective food) to give you vitamins and minerals; and GO FOOD (concentrated energy food) to give you calories to be active all day.

Two, be sure you eat enough food to give your body the energy it needs. This is even more important than the first suggestion. We get half or more of our energy from our MAIN FOOD. In most parts of the world, people eat one low-cost energy food with almost every meal. Depending on the area, this MAIN FOOD may be rice, maize, millet, wheat, cassava, potato, breadfruit, or banana. The MAIN FOOD is the central or 'super' food in the local diet.

A spoonful of cooking oil added to a child's food means he only has to eat about ¾ as much of the local main food in order to meet his energy needs. The added oil helps make sure he gets enough calories by the time his belly is full.
foods give you the most important part of your diet—calories. Half or more of our calories come from the MAIN FOOD, and most of the other calories come from GO FOODS.

WARNING ABOUT ‘GO FOODS’: Although GO FOOD gives us the energy we need, some GO FOODS are worse than others. Honey, molasses and especially white sugar can be very bad for the teeth, even though they have the calories we need. Fruits, nuts, and oils all give us energy (calories) without attacking the teeth.
2. Clean Your Teeth

Cleaning teeth requires time and care. If you hurry, you will leave food and germs behind, and they continue to make cavities and sore gums.

You may find that different dental workers recommend different ways of brushing teeth. Some ways are definitely better, but often they are harder to learn.

Teach a method of cleaning that a person can learn and will do at home. Let him start by scrubbing his teeth (and his children’s teeth) back and forth, or round and round. Encourage him to improve his method only when you think he is ready.

**Toothpaste is not necessary.** Some people use charcoal or salt instead. But it is the brush hairs that do the cleaning, so water on the brush is enough.

Scrub the outside, inside, and top of each tooth carefully.

![Diagram of toothbrushing steps]

1. Scrub the tooth.
2. Scrub the inside of the tooth.
3. Scrub the top of the tooth.
4. Scrub the outside of the tooth.
5. Sweep between the teeth.
6. Feel the tooth with your tongue.

When you finish, feel the tooth with your tongue to make sure it is smooth and clean.

Finally, push the hairs of the brush between the teeth and sweep away any bits of food caught there. Do this for both upper and lower teeth.

Sweep away in the direction the tooth grows: sweep upper teeth down and lower teeth up.
Explain how important it is to use a brush with soft hairs. A brush that is stiff and hard will hurt the gums, not help them.

You can make a hard brush softer by putting the hairs into hot water for a few minutes.

Do not put the plastic handle into the hot water, or it will melt.

If your store has only hard brushes, tell the storekeeper that hard toothbrushes do not help the people in the community. Ask him to order and sell only soft toothbrushes.

Note: Another important way to reduce cavities is by adding fluoride to teeth. Fluoride is a substance which, like calcium, makes teeth harder and stronger.

Fluoride in drinking water, toothpaste, vitamins, and mouth rinses, helps to prevent cavities. These methods are sometimes expensive. Perhaps the most effective and inexpensive method is the weekly rinse at school, described on page 167.

Fluoride can also be found naturally in food and water. For example, tea leaves and most foods from the sea contain a large amount of fluoride.

So, your source of fluoride can be either:
CLEANING BETWEEN THE TEETH IS VERY IMPORTANT

Here are three ways to clean between the teeth:

1. Push the hairs of a toothbrush between the teeth, and sweep the bits of food away.

2. Remove the stem from a palm leaf. Use the thinner end and move it gently in and out between the teeth.

3. Use some thin but strong thread or string. String can be the best method of all—but you must be careful with it.

Be careful! The string can hurt your gums if you do not use it correctly. The next page shows how to use the string, but the best way to learn how to 'floss' your teeth is to have someone show you. Ask a dental worker who has experience.
Wrap the ends of the string around the middle finger of each hand.

Use the thumb and finger to guide the string. Go back and forth to slide the string between two teeth. Be careful not to let it snap down and hurt the gums.

With your fingers pull the string against the side of one tooth. Now move the string up and down. Do not pull the string back and forth or it will cut the gum.

Lift the string over the pointed gum and clean the other tooth.

When you have cleaned both teeth, release the string from one finger and pull it out from between the teeth. Then wrap it around your two middle fingers once again, and clean between the next two teeth.

Remember: clean teeth and good food will prevent almost all dental problems.
Whenever you do an examination, remember to examine the mouth.

You can prevent much suffering and serious sickness when you notice and treat problems early. Whenever you hold a health clinic, try to find out how healthy each person’s mouth is.

Ask if she is having a problem now, or has had a problem recently.

Always write down what you find out, so you remember what treatment that person needs.

1. Are the teeth healthy?
   Look for:

   1. A New Tooth
      Tell the person what is happening and how to keep the skin around it healthy (page 64).

   2. Black Spots
      They may be cavities, which should be filled when they are still small (page 45).

   3. A Loose Tooth
      Tell the person what is happening and how to prevent it from getting worse or affecting other teeth (page 52).

   4. A Dark Tooth
      A tooth that is dark is dead. Infection from its root can go into the bone (p. 45). This can make a sore on the gums (p. 72).
2. Are the gums healthy?

Look at page 50 and compare the pictures of healthy and unhealthy gums. **Unhealthy gums often are red and they bleed when you touch them.**

A bubble on the gums below the tooth is a clear sign that the person has an abscess. The abscess may be from the tooth, or it may be from the gums. To decide, look carefully at both the tooth and the gum around it.

A bubble beside a healthy tooth is a sign of infected gums. Scale the tooth carefully. See Chapter 8.

A bubble beside a decayed tooth is a sign of a tooth abscess. See page 87. A sore on the gums from a badly decayed tooth appears when a gum bubble breaks open and lets out the pus from inside.

3. Are there any sores?

Look for sores under the smooth skin on the inside of the lips and cheeks. Look also under the tongue and along its sides.

![GUM BUBBLE](image)

1. A sore on the gums may be from an infected tooth (p. 87).
2. Sores on the inside of the lip or cheek may be from a virus (p. 98).
3. Sores on the lips or tongue may be cancer (p. 119).

After your examination, tell the person what you have found. If you notice a problem starting, explain what to do to prevent it from getting worse. If there are no problems and the mouth is healthy, congratulate the person.

**Share your knowledge—explain things to people. Help them learn how they can prevent and even manage their own problems with their teeth.**
WHERE TO EXAMINE

Examine people in a light and bright place. It is dark inside a person's mouth, so you need light to see the teeth and gums.

Use the sun. Examine outside, or inside a room facing the window. With sunlight alone, you will be able to see most places in the mouth well enough. If you cannot, set up a lamp or have someone hold a lamp for you. Reflect the light off a small mouth mirror onto the tooth or gum.

If you have a low chair, lift up the person's chin so that you do not have to bend over as far when you look into the mouth. An even better way is to have the person sit on some books. The person’s head can lean back on a piece of cloth.

Use an old chair with a strong back.

Attach two flat sticks to the chair. Then tie a strip of clean cloth to the sticks. Tie it strong enough to support the head, but loose enough to let the head lean back.

THE INSTRUMENTS YOU NEED

Three instruments are really enough:

1. A wooden tongue blade to hold back the cheek, lips, and tongue.

2. A small mirror to let you look more closely at a tooth and the gums around it.

3. A sharp probe to feel for cavities and to check for tartar under the gum.

If you have many people to examine, it is helpful to have more than one of each instrument. But be sure they are clean.

Dirty instruments easily can pass infection from one person to another. After you finish an examination, clean your instruments in soap and water and then leave them in a germ-killing solution like the ones described on page 85.
A GOOD DIAGNOSIS

You are making a diagnosis when you decide what a person's problem is and what is causing it. To do this, you need information. You need to make a careful examination to make a good diagnosis.

Learn all you can about the person's problem:
1. Ask questions about the problem.
2. Look at the person's face. Think about the person's age.
3. Examine the mouth more carefully than before.
4. Touch the place that is sore.

1. Ask the person about the problem.

Give a sick person a chance to describe how he is feeling.

Listen. Think about what possibly is happening in his mouth.

You may have an idea what the person has. Now try to find out more by asking questions:

- **What is the problem?** Ask him to talk about the pain, swelling, bleeding, or whatever he is feeling.
- **Where does it feel that way?** See if he can put his finger on the tooth or place that is bothering him.
- **When do you have the most pain?** Find out if it happens all the time or only some of the time.
- **When did it start?** Find out if he has already had this problem before. Ask how he took care of it.
- **Have you had an accident or injury lately?** Infection still inside the bone from an old injury in the mouth can make a sore on his face, or start swelling.
- **Are you having other problems?** A head cold or fever can make the teeth hurt.
- **How old are you?** Think about a new tooth coming into the mouth.

After you hear the answers to your questions, decide if your original idea is the correct diagnosis. If not, try to think of another possibility and ask more questions. This is the scientific method of making a diagnosis. For a good explanation of scientific method, see Chapter 17 of Helping Health Workers Learn.
When you talk to a woman, find out if she is pregnant. A pregnant woman’s gums can easily become infected. The gums may bleed and she may have more tooth decay. But this is not necessary. If a pregnant woman takes extra care of her teeth and gums, she can prevent most dental problems. But if she already has a problem, do not wait for the baby’s birth before you help her. You can treat a pregnant woman’s mouth problems now. In fact, this may be an important way of protecting her baby as well. See pages 177-179.

2. Look at the person.

People have some problems more often at certain ages. When a person first comes in to see you, notice his age. Then, before you ask him to open his mouth, look at his face for a sore or swollen area.
3. Examine inside the mouth.

Remember what the person said, the person’s age, and what you saw. Now look more closely at the problem area.

Look at the teeth:
- Is a new one growing in?
- Is a tooth loose?
- Is there a dark (dead) tooth?

Look at the gums:
- Are they red?
- Is there any swelling?
- Do they bleed?
- Are the gums eaten away between the teeth?

Look also for sores on the inside of the cheek or lips, and on the tongue.

4. Touch the sore place.

Touching is a good way to find out how serious the problem is. This will help you decide which treatment to give.

Push gently against each tooth in the area of pain to see if a tooth is loose. Rock the loose tooth backward and forward between your fingers, to see if it hurts when you move it.

Using the end of your mirror, tap against several teeth, including the one you suspect.

There is probably an abscess on a tooth that hurts when you tap it.

Press against the gums with cotton gauze. Wait a moment, and then look closely to see if they start bleeding. Then use your probe gently to feel under the gum for tartar. Carefully scrape some away. Wait and look again to see if the gums bleed. **When gums bleed, it is a sign of gum disease.**
LEARN TO TELL SIMILAR PROBLEMS APART

If a person comes to you with a toothache or a sore or a loose tooth, there are many possible causes for each problem. The first thing you notice—the toothache, sore or loose tooth—is your first step to a diagnosis. To this you must add more information before you can point to the most probable cause.

Put together what you have found with what you already know about teeth and gums. You can make a good diagnosis of a problem without knowing a special name for it.

Usually it is easy to make a diagnosis. However, sometimes you will not be sure, and these are the times to seek the advice of a more experienced dental worker. Never pretend to know something you do not. Only treat problems that you are sure about and have supplies to treat properly. See Where There Is No Doctor, p. w4.

Use the charts beginning here to help you make the diagnosis. For more practice using charts to tell problems apart, see Chapter 21 of Helping Health Workers Learn.

Treating Some Common Problems

You must make a good diagnosis to treat a problem so it finishes and does not return. Why treat a sore on the face by cleaning it when the sore is from pus draining from a tooth with an abscess? You need to know the cause of the sore to give the best kind of treatment.

After you make the diagnosis, you must decide whether you or a more experienced dental worker should provide the treatment.

Know your limits. Do only what you know how to do.

In the following pages, we describe the kinds of problems you as a health worker may see, and we also give the treatment for each problem. Use the table below to help you find the right page.

Before you touch the inside of anyone's mouth, learn how to keep clean. See the next 4 pages.

THE FIRST RULE FOR TREATMENT: STAY CLEAN!

No matter what problem you are treating, be sure that your workplace, your instruments, and you are always clean. For example, prevent infection by always washing your hands before you examine or treat someone.

Wash your hands in front of the person, in the same room. You will show that you are a careful and caring health worker. Also, you will demonstrate just how important cleanliness really is.

The mouth is a natural home for germs. They usually do not cause problems because the body is used to them. In fact, many germs are helpful. For example, when we eat, some germs break down chewed food into parts small enough for the body to use.

There are problems when the number of these ordinary germs increases greatly, or when strange, harmful germs come into a healthy body from outside. Fever and swelling follow. It is an infection.

When we regularly clean the mouth, the number of germs stays normal. You can teach others to clean teeth and gums, but cleaning is each person’s responsibility.

However, dental workers have one serious responsibility. You must not spread germs from a sick person to a healthy person. You must do everything you can to make sure your instruments are clean.
Germs hide inside bits of old food, cement, or blood on an instrument. There they can continue to live, even in boiling water.

This is why you must be sure to scrub the working end of each instrument carefully with soap and water. Rinse, and then look carefully to see that it is clean and shiny.

Remember that 'clean looking' is not necessarily 'clean'. Truly 'clean' means free of germs. Unless you sterilize, that instrument may still have germs, the kind that cause infection in the next person that it touches.

**Sterilizing means killing germs.** The best way to sterilize is with heat. High heat kills almost all harmful germs—especially those that cause hepatitis, tetanus, and mouth infections. Wet heat (steam) is always more effective than dry heat from an oven.

Here is a simple rule to use in deciding when to sterilize:

**Boil any instrument that has touched blood.**

That means always sterilize with steam all syringes, needles, and instruments you use when scaling teeth (Chapter 8) or when taking out a tooth (Chapter 11).

Be safe: When in doubt, sterilize!

Instruments left in boiling water need 30 minutes to become sterile. A pot with a cover to trap the steam can act faster. The inside becomes hotter and 20 minutes is enough. But remember that water can rust metal instruments. To prevent rust:

- Add 5 spoonfuls (20 ml.) of oil to every liter of water you boil.
- Then lay the hot instruments on a dry, clean (sterile, if possible) cloth, so the water can evaporate.

Never put an instrument away while it is wet.
Sterilizing with steam under pressure is the fastest and surest method. It kills harmful germs in 15 minutes. You need a strong pot with a tight fitting lid. But be sure to make a small hole in the lid so steam can escape when the pressure becomes too great.

A special pot called a pressure cooker is perfect for this. It even has a safety hole on it to release extra steam.

1. Put 2 cups of water and 2 spoonfuls of oil into the pot.

2. Place the handles together. Put on high heat until a loud hissing noise begins.

3. Put on lower heat. Begin timing now. Leave the hissing pot on the low flame for 15 minutes.

   DO NOT LET THE COOKER BOIL DRY!

4. Cool the pot under water, open, and lay the instruments on a clean towel to dry.

The next time you use the pot, you can use the same water that was left inside it.
Sterilizing with heat is not necessary for instruments that do not touch blood. For example, after you examine a person or place a temporary filling, you can clean your instruments and then soak them in a solution of alcohol or bleach.

**Alcohol solution**

1. Mix in a large container each week: 7 parts alcohol (95%) and 3 parts clean water. Keep the container tightly covered to prevent evaporation.

2. Keep a covered pan half filled with this mixture. You will have to add some more of the mixture from the large container (#1) to the pan each day.

3. Leave your clean instruments in the pan, completely covered with the liquid, for 30 minutes.

**Bleach (sodium hypochlorite) solution**

Find the cheapest brand name in your area for bleach. Examples are *Javex*, *Clorox*, *Purex*, and *Cidex*. Make 1 liter of solution with a mixture of 1/2 cup (100 ml) of bleach and 3 1/2 cups (900 ml) of clean water.

Unfortunately, bleach rusts metal instruments. To reduce rust, add 1 large spoonful of baking soda (sodium bicarbonate) to the solution, and leave your instruments in the solution for only 30 minutes.

Wipe each instrument with alcohol to remove the film of bleach. Then store it dry inside a clean cloth or in another covered pan.

Change the solution each week.
PART 1: PROBLEMS YOU WILL SEE MOST OFTEN

CAVITIES AND LOST OR BROKEN FILLINGS

A cavity can occur in any tooth. A cavity can also start around an old filling, especially if it is dirty. The deeper a cavity gets inside the tooth where the nerve lives, the more the tooth hurts.

SIGNS:

- pain when drinking water or eating something sweet
- a hole (or black spot) on the tooth, or between two teeth
- pain if food gets caught inside the hole
- no pain when you tap the tooth

TREATMENT (when there is no abscess):

Try to remove any loose piece of filling with a probe. Then, following the steps in Chapter 10, put in a temporary filling.

Now:

1. Fill the hole with cement. If you have no cement, put some cotton into the hole to keep food out.
2. Look for cavities or broken fillings in the other teeth. Fill each one with cement before it gets worse and starts to hurt.

Soon (within a few months):

3. Arrange for someone to replace the temporary filling with a permanent one. You will need a person who has experience using a dental drill (see p. 145).

A groove on the neck of a tooth is a more difficult cavity to fill. For the temporary cement to hold properly, you need to shape the groove with a drill. To help temporarily, you can paint the groove with fluoride water (page 167). Do this once each week until the inside part of the groove is stronger and the tooth hurts less. Or, you can paint the inside of the groove with oil of cloves (eugenol) to reduce the pain.

To avoid making the problem worse, (1) do not use a hard toothbrush; (2) do not brush back and forth along the gums; and (3) do not chew betel nut and do not hold it against the teeth.
TOOTH ABSCESS

A cavity that is not filled grows bigger and deeper until it touches the nerve. Germs travel inside the tooth’s root and start an infection called an abscess.

Pus forms at the end of the root, inside the bone. As the pus increases, it causes great pressure. This is why an abscess causes severe pain.

SIGNS:
• pain all the time, even when trying to sleep
• tooth often feels longer, and even a bit loose
• tooth hurts when it is tapped
• a sore on the gums near where the root ends (gum bubble)
• swelling of the gums around the tooth, or swelling of the face on the same side as the bad tooth

TREATMENT:

If there is no swelling, take out the tooth immediately (unless you are able to give root canal treatment). This allows the pus to escape and relieves the pain. See Chapter 11.

If there is swelling, treat the swelling first. Take out the tooth only after the swelling goes down. This is necessary because an anesthetic (see Chapter 9) will not work if there is swelling. If the anesthetic works, then it is safe to take out the tooth.

To treat the swelling, give an antibiotic. Penicillin by mouth is best. Use an injection only when the person is in immediate danger. For example, inject penicillin when the person has a fever or if the swelling is pressing against the throat. But remember you can treat most serious infections with simple penicillin by mouth. For the doses for serious infections, look below the box on the next page. If you still think an injection is necessary, look at the section on ‘aqueous procaine penicillin’ on page 166.

Adults and children over 25 kg. (60 pounds) of weight should take the same amount of oral penicillin. Children under 25 kg. should take 1/2 as much. For most infections, penicillin by mouth is taken 13 times: a very large first dose and 12 smaller doses every 6 hours for 3 days. The person should take all of the penicillin, even if the pain or swelling goes down. For the correct doses, see the next page.
For serious infections, it may be necessary to take the antibiotics for a longer time. Take the same first dose as above, then take 1/2 the first dose every 6 hours until the condition begins to improve. Then take the second, smaller dose every 6 hours until the end of five days, or seven days if it is very serious.* Usually you can take out the tooth 1 or 2 days before the end of the antibiotic treatment, but the person must continue to take all of the tablets, even after you have taken out the tooth.

If the swelling is ‘pointing’, open it with a sharp sterile knife to release the pus. Cover the wound with a sterile dressing to keep it clean. If you are not able to do that, explain how to reduce the swelling-with heat. As often as possible until the swelling goes away:

- soak a cloth in warm water and hold it against the face.
- hold warm water inside the mouth near the swelling. It is not necessary to add salt to the water.

Finally, give the person medicine for pain. A two-day supply will be enough, because the penicillin and the heat will reduce the pressure and that will reduce the pain. The best medicines for pain are aspirin, which comes in 300 mg. tablets, and acetaminophen (paracetamol), which comes in 500 mg. tablets. Aspirin is usually cheaper, but acetaminophen does not cause stomach pain and it is safer than aspirin for children. (To avoid stomach pain, take aspirin with food, milk, or water.)

Take aspirin or acetaminophen 4 times a day. Every 6 hours, adults can take 2 tablets, children 8 to 12 years take 1 tablet, and children 3 to 7 take 1/2 tablet. Children 1 to 2 years should only take acetaminophen, 1/4 tablet 4 times a day. See page 165.

*If the infection does not heal, penicillin may not be the best antibiotic. Take some pus from the infection and have it tested, to see which antibiotic is best.
INFECTED SINUS

A sinus is a hollow place inside the bone. There is a sinus under the eyes, on each side of the nose. Because the sinus is very close to the roots of the top teeth, these teeth may hurt if the sinus becomes infected.

SIGNS:

- toothache in several top teeth. The teeth look healthy, but hurt when you tap them.
- a head cold, and plugged nose. She can only breathe through her mouth.
- hurts when you press against the bone under her eyes.

TREATMENT:

Do not take out any teeth. They will feel better after you treat the sinus infection.

1. Give penicillin for 3 days (page 88).

2. Explain to the person that she should:
   - drink lots of water.
   - breathe steam from boiling water—to clear her nose.
   - hold a warm wet cloth against her face, as often as possible.
   - not try to blow her nose, or else her ears will hurt. Wiping the nose is better.

3. See the person again after 3 days, and
   - examine her teeth closely, tapping them to be sure they are strong and healthy.
   - if she is not better, get help from a more experienced health worker.
TOOTH INJURIES

1. Broken tooth

It is possible to save a broken tooth. It depends on where the tooth is broken and whether its nerve is still covered.

SIGNS:

- pain when breathing air or drinking water
- blood from the gums around the tooth
- tooth moves when you touch it

TREATMENT:

Take out the broken tooth if:

- its nerve is not covered. If no one can give special root canal treatment, the tooth must come out. Germs from the spit have already gone inside the tooth and started a small infection.
- its root is broken. To see if it is broken, push gently against the tooth as you feel the bone around its roots. The tooth’s root probably is broken if the tooth moves but the bone does not. The root probably is not broken if both the tooth and bone move. However, the bone around the roots may be broken (page 103).

You can save a broken tooth if the nerve is still covered and the root is not broken. To do this, use a file on the sharp edges around the break. This makes them smooth so they do not cut the tongue. Later, an experienced dental worker who has the equipment can cover the broken part with a cap or a filling. Until this is possible, tell the person how to protect the tooth:

- Give the tooth a rest. Use other teeth to eat.
- Do not drink things that are very hot or cold, and do not eat spicy food.
- Watch the tooth. See if it changes color (gets darker). Also watch the gums near the root. See if a sore (gum bubble) develops.

A dark tooth and gum bubble are signs that the tooth is dying. Take it out, unless you can give special nerve treatment.
2. Tooth knocked out

When a tooth is knocked out of the mouth, you should ask two questions: (1.) Was it a baby tooth? and (2.) How long ago did it happen?

Baby tooth. There is no reason to try to put a baby tooth back into the socket. Tell the child to bite on some cotton to stop the bleeding. Then wait for the permanent tooth to replace it. Warn the mother that the permanent tooth may take more time than usual to grow into the mouth.

Similarly, there is no need for treatment if the baby tooth is pushed up under the gum.

The tooth may grow back into the right place later, or it may turn dark and die. If you see a darkened tooth or a gum bubble (p. 72), take out the baby tooth before it hurts the permanent tooth that is growing under it.

Permanent tooth. A permanent tooth is worth saving. How long ago was it knocked out? If it was less than 12 hours ago, you can put a permanent tooth back into the socket. The sooner you do this the better, so do not wait. If you replace the tooth in the first hour, it has a much better chance of joining with the gum and bone. In order to heal and to join the bone, the tooth must be held firmly.

1. Wash the tooth gently with clean water. There should not be any bits of dirt on the root of the tooth.

   Keep the tooth damp with wet cotton gauze.

Do not scrape away any skin from the root or from the inside of the socket.
2. Gently push the tooth up into the socket. As you push it up, use a slight turning movement back and forth.

The biting edge of the loose tooth should be at the same level as the teeth beside it.

Hold it in place with your fingers for about 5 minutes.

3. Soften some beeswax and form it into 2 thin rolls. Place 1 roll near the gums on the front side of five teeth: the loose tooth and the two teeth on each side of it. Press the wax firmly, but carefully, against these teeth.

Do the same with the second roll of wax on the back side of the same teeth, again near the gums.

It is good if the wax on the back side is touching the wax on the front side. This helps the wax hold the teeth more firmly. To do this, you can push the wax between the teeth with the end of your cotton tweezers.

Tell the person with the injured tooth to return to see you several times. The tooth may die several months or even several years later (see page 45). If that happens, you must take out the tooth, unless you can do root canal treatment.

If it is possible, take an X-ray of the tooth 6 months later and then again each year. Look at the X-ray picture of the root to be sure an infection is not eating it away. To do this, compare the root with the roots of the teeth beside it.
LOOSE TOOTH

A tooth may be loose for one of several reasons. Decide the reason before giving the treatment.

<table>
<thead>
<tr>
<th>IF THE TOOTH IS LOOSE BECAUSE</th>
<th>THE BEST TREATMENT:</th>
</tr>
</thead>
<tbody>
<tr>
<td>a new permanent tooth is growing under it.</td>
<td>1. tell the mother and child what is happening. 2. pull out the loose baby tooth, if it is hurting the child.</td>
</tr>
<tr>
<td>gum disease or an old abscess has eaten the bone around its roots.</td>
<td>1. take out the tooth, especially if it also hurts. 2. explain to the person what to do to prevent this problem in other teeth. (See Chapter 5).</td>
</tr>
<tr>
<td>its root has been broken.</td>
<td>take out both parts of the tooth. If you have trouble taking out the broken root, leave it and try again a week later.</td>
</tr>
<tr>
<td>the bone around its root is cracked. (The bone moves when you push against the tooth.)</td>
<td>Do not take out the tooth. If you do, the bone will come out with it. Instead, hold the tooth with wires (page 104).</td>
</tr>
</tbody>
</table>

A tooth may also be loose because another tooth is biting too hard against it.

SIGNS:
- you can feel the tooth move when the upper and lower teeth meet.
- that tooth hurts.

TREATMENT:

You need to remove a bit of each of the teeth that are biting too hard. Use either a dental worker’s drill, a small file, or a hard stone.

1. Smooth the **inside** edge of the **upper** tooth.
2. Smooth the **outside** edge of the **lower** tooth.
NEW TOOTH GROWING IN

A new tooth cuts through the gums when it grows into the mouth. Germs can easily go under the gums in that place and cause an infection. When the opposite tooth bites against the sore gum it can make an infection worse.

**SIGNS:**
- toothache at the back of the jaw
- mouth cannot open properly
- a bad taste coming from the back of the mouth
- sore throat
- skin over the new tooth is sore and hurts when you touch it
- the age of the person is the right age for growing a new molar tooth (page 64).

**TREATMENT:**

*Do not take out a new tooth while there is still infection and pain.* Wait for the infection to finish. Then decide if there is room for the tooth to grow in. A dental X-ray can help you make that decision. New molar teeth are often difficult to take out. Ask an experienced dental worker to take out the tooth, if it must be done.

**What you can do**

First, treat the infection. Then wait for the new tooth to grow more into the mouth. Tell the person what is happening. Tell him what he can do to keep the gums healthy while the tooth grows in:

- Rinse the area with warm salt water (page 7). Make 4 cups each day until the mouth opens normally again. Then make 1 cup each day to prevent the problem from returning. Keep rinsing this way until the tooth grows all the way in.
- Hold a warm wet cloth against the jaw as often as possible each day.
- Take aspirin for pain (page 88).

Give penicillin (page 87) if there is fever, a swelling, or if he is only able to open his mouth a little.
TEETHING

When babies and small children first get their teeth, it is called teething. This can make the child unhappy, because his gums are sore.

Teething does not cause fever, head colds, or cough.

But a child can have any of these problems at the same time as he gets a new tooth.

TREATMENT:

If the child has another sickness, do not blame it on teething. Look for another cause and treat it separately. Also, do not cut the gum over the new tooth. Let the tooth grow through the gum by itself.

1. Give acetaminophen or aspirin for pain and fever (page 88).
2. Give the child something hard to bite against. This will help the tooth to grow through the gums faster. For example, let him chew on a dry hard biscuit.

GUM DISEASE STARTING

Infection can start in the gums whenever the teeth near them are not clean. For example, there may be swelling (called an epulis) between only 2 teeth or between many teeth. In addition, gums that are weak from poor nutrition are not able to resist the infection. This is why a pregnant woman must take special care to eat well and clean her teeth carefully.

SIGNS:

- Gums are red instead of pink.
- Gums are loose instead of tight against the tooth.
- Between the teeth, gums are round instead of pointed.
- Gums bleed when you press against them, or when you scrape away food from under them.
- The person has bad breath and a bad taste inside the mouth.

Feel for tartar under the gum—or even a piece of fishbone.
**TREATMENT:**

Explain to the person the cause of her gum problem and what she can do to help herself.

1. Show her how to clean her teeth better near the gums (page 67).
2. Tell her to rinse her mouth with warm salt water (page 7). Make 4 cups each day until the bleeding stops. Then make 1 cup each day to keep the gums strong and tough.
3. Tell her to eat fresh fruits and vegetables. Guavas, oranges, pineapples, papayas, tomatoes, peas, and green leaves give strength to gums.
4. Gently reach under the gums and remove tartar (or loose piece of fishbone) that is caught there (see Chapter 8).

**MORE SERIOUS GUM DISEASE**

*Vincent’s Infection of the gums*, also called *trench mouth*, affects both adults and children. In its worst form, it can eat a hole through the cheek of a weak child (page 115).

A person with Vincent’s Infection may not want to eat because his teeth hurt when he chews food. That can make a child’s malnutrition worse.

You must prevent this problem from starting, especially in a child who is weak from sickness. Teach mothers to clean their children’s teeth and to get their children to rinse their mouths with warm salt water.

**SIGNS:**

- gums between the teeth are dying and turning gray.
- pus and old blood collect around the teeth.
- burning pain from the gums.
- bleeding from the gums.
- the mouth smells bad.

**TREATMENT:**

You will need to see the person over a two-week period. Start some treatment *NOW*:

1. If the person is already sick, give penicillin for 3 days (page 88).
2. Clean away the pus, old food, and big pieces of tartar. Then:
   - Tell the person to rinse his mouth with warm water.
   - Wipe his gums with cotton soaked in a 5% solution of hydrogen peroxide. Rinse with warm water. For a child, use a weaker solution. Mix 1 part hydrogen peroxide with 5 parts water and wipe the child’s gums with it.
   - Scrape away the bigger pieces of tartar. Do not try to remove all of it. You can do that later. Put topical anesthetic on the gums if you have some (first dry the area with cotton so the topical anesthetic will stay longer). Rinse away any loose bits of tartar with warm water.

3. Give Vitamin C (ascorbic acid), 2 tablets a day for 7 days.
   (1 tablet = 500 mg.)

4. Teach the person how to care for the gums at home:
   - Rinse at home for 3 days with a weak solution of hydrogen peroxide (page 8). Try to hold the solution in the mouth for several minutes. The longer the solution touches the gums, the better it is for the gums. Rinse once every hour. After 3 days, change to salt water, 4 cups a day. **If you have no hydrogen peroxide, rinse with salt water from the beginning.**

   For a young child who is not able to rinse, Mother or Father can wipe his gums with the weak solution of hydrogen peroxide 4 times a day.

   Show parents how to do this. Give them some cotton gauze and hydrogen peroxide to take home.

   - Clean the teeth with a soft brush. Parents can clean children’s teeth. Show them how (page 16), and ask them to do it even if the gums bleed.
   - Cook food that is soft (like pounded yam) and not spicy (no pepper). Eat fresh fruits and vegetables that give strength to the gums (page 96).
   - Stop smoking and stop chewing betel nut.

   **One week later**, scrape away the rest of the tartar from the teeth. Then use the person’s own brush and show him how to do a better job of cleaning his teeth.
FEVER BLISTERS

Herpes virus causes fever blisters. Herpes virus is a kind of germ. Fever blisters are sores that can form either inside the mouth on the gums, or outside on the lips.

When the sores are inside the mouth, it is a serious problem. It usually affects children between 1 and 5 years old. A child with fever blisters in his mouth can become very sick. He will not be able to eat properly. If he does not drink enough fluids, he can become dehydrated (lose his body water). This is dangerous!

SIGNS:
- sore throat
- fever
- crying, stops sucking 2-3 days before sores appear
- spit spills from the mouth because it hurts to swallow
- painful swelling under the jaw.
- bright red blisters on the gums, but not between the teeth.

Blister also may be on the roof of the mouth.

TREATMENT:

Medicine cannot kill the Herpes virus. The sores will go away by themselves in about 10 days. The treatment is to help the person feel more comfortable and to be sure he gets enough to eat and drink.

1. Give aspirin or acetaminophen for fever (page 88).
2. Wipe milk or yogurt over the sores to protect them before eating. Wash your hands before touching the inside of someone’s mouth! (See page 82.) Then give food that is soft and not spicy. If he cannot eat, prepare a special milk-oil drink for him, as on page 105.
3. Give lots of fluids to drink.

Sores on the lips usually occur after the age of 5. They often appear when the person is weak and sick (for example, with diarrhea or pneumonia.) Usually there is no fever. The blisters soon break open and release water. When they dry, a crust forms. The blisters often return.

These sores go away in about 1 week. To prevent them from becoming infected, paint the sores with gentian violet, tincture of benzoin, or petroleum jelly. If you hold ice against the sores for several minutes each day, it may help them heal faster.
THRUSH

Thrush is a kind of infection. It often appears when a person is weak and poorly nourished, or sick and taking medicine like tetracycline or ampicillin. In a baby, thrush usually appears on the tongue or top of the mouth. It can stop the baby from sucking. In an adult, thrush often occurs under a denture.

SIGNS:
- White patches on the tongue, cheek, or top of the mouth.
- Wipe the white area:
  - If there is no bleeding it is old milk.
  - If there is bleeding, it is thrush.
- the child may not want to suck or eat.

TREATMENT:

There is usually something else present which is helping thrush to grow. Try to find what it is and deal with it. For example, treat the malnutrition, change or stop the antibiotic medicine, or leave the denture out of the mouth for a while. Then:

1. Put some nystatin creme on top of the white patch with a bit of cotton.
   - adults: put some on 4 times a day
   - children 5-12 years: put some on 3 times a day
   - children up to 5 years old: put some on 2 times a day

   Show the mother how she can do this in her child’s mouth at home. If you have no nystatin creme, paint gentian violet on the white area. The mother should paint the child’s mouth 2 times a day.

   Do not use penicillin or any other antibiotic unless you need to treat something different. Thrush can get worse when a person uses an antibiotic for a long time.

2. Continue breast feeding. For older persons, make their food soft and easy to chew.

IMPORTANT: Sometimes white lines appear on the inside of an adult’s cheek or on the roof of the mouth. If these lines become sore, they can change into a cancer (page 119). To prevent this cancer, ask the person to stop smoking (especially pipes), stop chewing betel nut, and get dentures adjusted if they do not fit properly.
CANKER SORES

A virus can cause canker sores, as with fever blisters. Unlike fever blisters, canker sores usually affect adults rather than children.

One or more sores can appear at any time. These sores hurt, especially when pieces of food touch them.

SIGNS:

- A sore can appear on the tongue, roof of the mouth, or below the gums on the smooth skin.
- The sore is white or yellow with the skin around it bright red.
- The person may have had a similar kind of sore before. It tends to come back.

Note: a sharp edge of a denture rubbing against the gums can make a similar kind of sore.

TREATMENT:

A canker sore goes away by itself in about 10 days. Medicine does not make that happen any faster. (However, smoothing a denture does help.) The treatment is simple. Tell the person how to feel more comfortable while waiting for the 10 days to pass:

Eat foods that are soft and not likely to hurt the sore. Do not eat food with a lot of pepper. Drink lots of water. Chew food on the other side of the mouth, away from the sore.

A denture which does not fit should be remade. In the meantime, leave the denture out of the mouth for 2-3 days. Ask the person to rinse with warm salt water, 4 cups each day until the sore is better.

If the sore continues after 10 days, it may be infected. Give penicillin (page 87).

A sore that does not heal after antibiotic treatment may be cancer. See a doctor immediately.
SORES AT THE CORNERS OF THE MOUTH

Teeth support the lips. When they come together for chewing, the teeth stop the person's chin from moving any closer to the nose.

A person without many teeth looks old. A person with a poor fitting denture also looks old.

The distance from his chin to his nose is shorter than normal.

He must close his jaw further to eat. That causes lines to form at the corners of his mouth.

Poor health can make lines at the corners of the mouth crack and become sore.

A person with missing teeth needs dentures. Dentures will help him chew more food and make him look younger. They support his lips and open his mouth more.

**Note:** Making dentures is not easy. We hope to write a book in the future that will tell more about dentures.

A child who has had a fever or measles often has dry lips. The corners of her mouth can crack and become sore.

Cracks and sores appearing at the corners of a child's mouth are signs of dehydration and malnutrition.

The child needs to eat the kind of foods that give strength, energy, and protection. Feed her beans, milk, eggs, fish, oils, fruits, and green leafy vegetables (see page 65).

**TREATMENT** (when sores occur):

1. Wash the sores with soap and hot water.
2. Mix 1 part sulfur with 10 parts of petroleum jelly (*Vaseline*).
3. Smear some on the sores 3-4 times a day.
PART 2: SOME SPECIAL PROBLEMS

You will find some problems that are too serious for you to treat. If you can, send the sick person to a more experienced dental worker as soon as possible.

Sometimes, however, it is better to start some of the treatment yourself. Early treatment can prevent some problems from becoming more serious. Also, if you know what to do when someone returns from the hospital, you can help that person to get well faster.

Sometimes, you will find it impossible to get help. Therefore, we will discuss each of these more serious problems in detail, so you can give as much help as necessary.

BROKEN BONE

Three main bones form the face and lower jaw.

1. cheek bone
2. upper jaw bone
3. lower jaw bone

A bone can break completely, or part of it can crack. In either case, the teeth are usually pushed out of position. Look for this as a sign of a broken bone.

SIGNS of a broken bone:

- The person has had an injury.
- When teeth are closed, some upper teeth do not meet lower teeth.
- The person cannot open or close the mouth properly.
- There is bleeding from between 2 teeth.
- There is swelling or a bruise on the face or jaw.
- There is bleeding into the eye.
SIGNS of a cracked bone around the tooth’s roots:

- When you move one tooth, the tooth beside it also moves.
- When you move the loose tooth, the bone moves with them.
- Blood is coming from under the gums.

TREATMENT:

When a bone is broken or cracked, the treatment is to hold the broken parts together so that the parts can rejoin. The usual way to do this is to put wires around the teeth. An experienced dental worker should do this. There are two things you can do. First, provide emergency care. Later, show the person how to eat and how to keep his mouth clean.

**Emergency care (pages 103-104):**

1. Be sure the person can breathe.
2. Stop the bleeding.
3. Put a bandage on the person’s head.
4. Give penicillin to stop infection.
5. Give aspirin for pain.

1. Be sure the person can breathe.

Lie him on his side so that his tongue and jaw fall forward.

Later, carry him to the hospital in that position. If he goes in a car, be sure he sits with his head forward. His jaw and tongue will be forward and he will breathe more easily.

Look inside the mouth to see if any tooth is broken and very loose. A broken piece of tooth can fall out and block the person’s airway, so take out the broken part now. You can leave in the root, but if you do, tell the dental workers at the hospital (p. 175). They will remove the root when they put on the final wires.

2. Stop the bleeding.

Wipe away the dried blood from his face and from inside his mouth. Look for the place that is bleeding. Sew any deep cuts on his face (see Where There Is No Doctor, p. 86). If you gently press cotton gauze against the bleeding gums, it will usually control the bleeding.
Bleeding inside the mouth, from between the broken parts of the bone, is more difficult to stop. You must pull the two sides together and hold them in that position. To do this, you need wire that is thin, strong, and bends easily. 'Ligature wire' (0.20 gauge) is best.

Place a piece of wire around two teeth, one on each side of the break. Choose the strongest tooth on each side—the ones with the longest or the most roots. Tighten the wire around the two strong teeth with pliers or a hemostat.

Ask the person to close his teeth. Lift up the broken part of the jaw and hold it so the lower teeth meet the upper teeth properly. This is the normal way the jawbone holds the teeth.

Now join the wires. Twist and tighten them together. This may be painful. You can inject local anesthetic—see Chapter 8. You must twist the wire tight enough to hold the broken parts together.

Bend the end of the twisted wire toward the teeth. Now it cannot poke the person's lips or cheek.

3. Put on a head bandage.

Gently close the person's jaw so that his teeth come together. Support it in this position with a head-and-chin bandage.

Tie the bandage to support the jaw, not to pull it. Do not make it too tight. It is all right if his mouth stays partly open with the teeth slightly apart. Be sure not to let the bandage choke the person.

4. Give penicillin by injection (page 166) for 5 days to stop infection inside the bone.

5. Give something for pain. Aspirin (p. 88) may be enough. If there is a lot of pain and the person cannot sleep, give codeine. The dose for an adult is 30 mg.
Send the person to the hospital as soon as possible. The person must have wires placed on his teeth within a week of the accident. The wires must remain there for 4 to 6 weeks. Every week, the person must return to the hospital to have the wires tightened. During this time he cannot open his mouth to chew food or brush his teeth.

**Caring for a person who cannot eat properly (see below):**

1. Give him liquids containing food for both strength and energy.
2. Show him how to keep his teeth clean and his gums tough.

### 1. Give liquid foods for strength and energy.

Prepare food in two ways: (1) First, a milk-oil drink to build strength; and then (2) a special soup to keep him strong and give him energy.

**To build strength: Milk-oil drink**

Mix for him each day at your clinic:

- 9 cups of water
- 3 cups of milk powder
- 150 ml of peanut oil or coconut milk
- 1/2 cup of honey or 1 cup of sugar

Leave some near his bed, and keep the rest in a cool place.

**To keep strength and give energy: Special vegetable soup**

Cut into small pieces and cook together in a pot of water:

- 1/2 tin of fish, or a handful of dried fish
- 4 small spoonfuls of peanut oil or palm oil
- 6 sweet potatoes or small yams
- 1 large handful of green leaves
- 1 small spoonful of salt

Pour the soup into an empty tin with small holes made in the bottom. Use the back of a spoon to press as much of the cooked food as you can through the holes. The person can suck the soup between the teeth to the throat and then swallow it. Clean the tin and set it in boiling water, so you can use it again the next day.

### 2. Keep the teeth clean and the gums tough.

The person must learn to clean teeth and gums or the gums can quickly become infected and the mouth will feel sore. So:

- Scrub both the wires and the teeth with a soft brush after drinking soup.
- Rinse with warm salt water (page 7), 2 cups every day.
If the bone around the roots of the teeth is cracked, those teeth will be loose. **Do not take the teeth out until the bone is healed.** Otherwise, bone will come out with the teeth and there will be a big hole in the jaw. Instead, support the teeth, in order to hold both sides of the bone steady.

1. With your thumb and finger, gently move the loose teeth and bone back into normal position.

2. Cut a hypodermic needle and use it as a splint. Make it long enough to fit around two strong teeth on each side of the loose teeth. Curve the needle so it fits the curve of the teeth. To make the sharp ends smooth, use a file or rub the ends against a stone.

3. Tie each tooth to the needle. Use short pieces of 0.20 gauge ligature wire (page 104). Put one end of the wire under the needle. Bring it around the back of one tooth and out to the front again over the needle. Use the end of a small instrument to hold down the wire at the back of the teeth. Then twist the ends together. Tighten the wire around each one of the 6 teeth.

4. Cut the ends of the ligature wire. Turn them toward the teeth, so they will not cut the lip.

5. Tighten the wires the next day, and then once each week. But be careful. Only 1/2 a turn usually is needed. More, and the wire will break. Always twist in the direction a clock moves. With this habit, you will remember which way tightens the wire and which way loosens it.

6. Explain to the person that it takes 4 weeks for the bone to heal. The wires must remain on the teeth for this time. To help the teeth to heal, ask the person to:
   - give these teeth a rest. Use other teeth for chewing.
   - clean both the teeth and the wires with a soft brush.
   - rinse with warm salt water, 2 cups every day (p. 8).
   - return to have the wires tightened every week.

7. After 4 weeks, cut and remove the wires. **Ask the person to watch those teeth.** A dark tooth and gum bubble are signs that the tooth is dying. Take it out, unless you can give special nerve treatment.
DISLOCATED JAW

If a person opens her mouth wide and then is unable to close it, we say her jaw is dislocated. It is stuck in the open position. This problem often happens to a person who does not have several of her back teeth. When she opens wide to yawn or shout, the part of her jaw that joins her head moves too far forward inside the joint. It is then unable to return to its normal position.

SIGNS:

- She is unable to close her teeth together.
- She cannot close her lips easily.
- Her lower jaw looks long and pointed.
- It hurts when you press on the joint in front of her ear.
- She cannot speak clearly.

TREATMENT:

The treatment is to try to move the lower jaw back where it belongs. Then hold it in that position until the muscles can relax.

1. Find a way to support the person’s head. For example, have the person sit on the floor with her head against a wall.

2. Kneel in front of her. Put your fingers under her jaw, outside the mouth. Put your thumbs beside her last molar tooth on each side. Do not put your thumbs on the molars. The person may bite them!

   Press down hard with the ends of your thumbs. Force the jaw to move quickly down and back into position. Be sure to press down before you press back.

   If the jaw will not move, perhaps the muscles are too tight. A doctor or dentist can put the person to sleep, which will relax the muscles.

3. Support the jaw with a head-and-chin bandage for 3 to 4 days (page 104).

4. Give aspirin for pain (page 88).

5. Explain the problem to the person and tell her how to care for her jaw: (1) eat mostly soft foods for 2 weeks; (2) hold a warm wet cloth against the jaw; (3) remember not to open the mouth wide anymore. If possible, replace the missing back teeth with dentures (page 101).
PAIN IN THE JOINT

A joint is the place where one bone joins another. The jawbone has two joints, for it joins the head in front of each ear.

The mouth opens and closes because:

- muscles pull the jawbone; and
- the jawbone slides against the head bone, inside the joints.

Pain in these joints may be because:

1. The muscles are tight because the person is tense or nervous.
2. The jawbone is fractured in the area of the joint.
3. The teeth do not fit together properly.

TREATMENT:

Before you treat, decide what is causing the pain. We will discuss the three causes mentioned above.

1. Tension.

Talk with the person and help, if you can, to find a solution to her personal problems. This can do much to help her and her muscles relax. In addition, explain how to care for the sore joint:

(a) Eat only soft foods until it no longer hurts to chew.
(b) Hold a hot, wet cloth against the jaw, to help relax the muscle. Do this as often as possible, but be careful not to burn the skin.
(c) Take aspirin (page 88) to reduce the pain.

2. Fracture.

If an X-ray shows a fracture, the person needs expert help. A dentist can wire the teeth in a way that will allow the bone to heal.

3. Teeth do not fit together properly.

Imagine a line that passes between the two middle upper teeth and the two middle lower teeth in the person's closed mouth (see the next page). When the person opens the mouth, this line becomes longer, but it is still a straight line. If it is not, this condition can, after a long time, cause pain in the joint.
These teeth are normal. The line formed between the two middle teeth does not shift when the mouth opens.

When you see teeth that do not fit properly:

(a) Warn the person not to open his mouth wide. Suggest, for example, that he take his food in small bites.

(b) Tell the person what can be done to help. Often a dentist can grind the teeth in a special way and this can end the pain.

These teeth do not fit properly. Because the line shifts, this means the jaw is also shifting. This shift can cause pain in the joint.

SWOLLEN GUMS AND EPILEPSY

Many persons who suffer from epilepsy (see Where There Is No Doctor, page 78) have a problem with swollen gums. In severe cases, the gums are so swollen that they cover the teeth. This problem is caused not by epilepsy but by diphenylhydantoin (Dilantin), a drug used to control epilepsy.

When you see swollen gums, find out what medicines the person is taking. If possible, change to a different drug. If the person must continue using diphenylhydantoin, explain how to prevent this swelling of the gums. Show the person this book, especially pages 67 to 70. Persons who take this drug may be able to prevent the swelling by brushing the teeth carefully after each meal, and taking special care to clean between the teeth. (page 69).
BLOOD IN THE MOUTH

Use wet cotton gauze to wipe away the old blood from inside the mouth. Then you can see where it is coming from. Treat the cause of the bleeding.

PROBLEMS AFTER YOU TAKE OUT A TOOTH

Problems like swelling, severe pain, and bleeding can occur after you take out a tooth. Tetanus (p. 112), a more serious problem, can also occur, especially if your instruments were not clean.

Swelling of the face

You can expect some swelling after you take out a tooth. But if the swelling continues to grow, and it is painful, this is not normal. Probably an infection has started. The treatment is the same as for a tooth abscess: penicillin for 3 days to fight infection, heat to reduce the swelling, and aspirin for pain. See page 88 for the proper doses.
Pain from the Socket

There is always some pain after a tooth is taken out. Aspirin is usually enough to help.

However, sometimes a severe kind of pain starts inside the tooth’s ‘socket’ (the wound) 2 to 3 days after you take out the tooth. This problem is called dry socket and it needs special care.

TREATMENT:

1. Place a dressing inside the socket. Change it each day until the pain stops.

First, clean out the socket.
Squirt warm water inside the socket with a clean syringe. After the person spits out the water, squirt water inside once more. Use a blunt needle so that it does not hurt the gums or bone if it touches them.

Second, prepare the dressing.
Soak 1-2 small pieces of cotton in eugenol (oil of cloves). Squeeze each piece so that it is damp but not wet.

Note: There may be a local medicine in your area that relieves pain. Use it instead of eugenol.

Third, place the dressing gently inside the socket.
Place one piece of dressing into each root space. Push it down into the root space gently.
Cover the socket with plain cotton gauze, and send the person home biting against it. He can remove the plain cotton in an hour. The dressing should remain inside the socket.

2. Give aspirin for pain (page 88).
Bleeding from the socket

When you take out a tooth it leaves a wound, so you can expect some blood. However, if the person bites firmly against a piece of cotton, it usually controls the bleeding. To help the wound heal (from a clot), tell the person not to rinse with salt water or spit for 1 or 2 days after you take out the tooth.

When the first bleeding occurs, put a new piece of cotton on top of the wound and ask the person to close her teeth against it for an hour. Keep her there with you, to be sure she continues to bite on the cotton. (If it is too painful, you may want to inject anesthetic. See Chapter 9.) Change the cotton if it becomes soaked with blood.

**TREATMENT** (if the bleeding continues):

1. Take her blood pressure (see *Helping Health Workers Learn*, page 19-13). If it is high, you may need medicine to bring it down. That can help slow the bleeding.
2. Look carefully at the wound. If the gum is torn or loose, put in a suture (pages 155-157).
3. Wrap tea leaves in cotton gauze. Soak the bundle in water and then put it on the socket. Have the person bite against it. Or, have her bite against cotton gauze soaked with cactus juice.

Let the person go home only when the bleeding stops. Give her some clean cotton to use in case the bleeding starts again later (see page 157).

**TETANUS**

This is a very serious infection. Tetanus germs enter the body when a wound, like a wound on the bottom of the foot, gets dirty. Germs can also be carried to the socket when you use a dirty instrument to take out a tooth. To avoid this, carefully read pages 82 to 85.

**SIGNS:**

- the jaw becomes stiff and tight
- it is hard to swallow
- the whole body becomes tight, with sudden spasms

**TREATMENT:**

A person with signs of tetanus requires immediate medical help. See *Where There Is No Doctor*, page 182, if you cannot get help immediately.
INFECTION INSIDE THE SPIT GLAND

Spit glands are places where the spit is made. They are located in front of the ear and under the jaw, on each side of the head. If there is an infection inside a spit gland, the face will become swollen and the area will hurt.

Spit is sent from the gland to the mouth through a thin pipe called a duct. Ducts open into the mouth in two places: on the inside of each cheek, and under the tongue.

A small stone can often block a duct and cause an infection in the spit gland and swelling of the face. You may be able to feel the stone near where the duct enters the mouth.

SIGNS:
- swelling in the area of the spit gland.
- pain which gets worse when the person is hungry, and when he sees or smells food.
- the opening of the duct is red, swollen, and hurts when you touch it.

TREATMENT:
Reduce the infection and swelling first. Later try to remove the stone.

1. Give penicillin for 3 days (page 88). If the swelling is large and the infection serious, start with short-acting crystalline penicillin (see p. 166).
2. Give aspirin for pain (page 88).
3. Apply a wet hot cloth to the swelling as often as possible.
4. Give enough soft food to prevent the person from feeling hungry. The pain will be less then.
5. When the person feels better, a dentist or doctor can remove the stone that is blocking the duct.
SORES ON THE FACE

Whenever you see a sore on a person's cheek or under his chin, remember there may be a tooth or gum problem. If it is a gum problem, it may be Noma. See p. 115.

A bad tooth:

Ask him to open his mouth. Look for an infected tooth in the area of the sore.

There may be a large cavity and the tooth may be loose.

Or the tooth may be darker in color than the others. This is because it is dead.

The pus is draining onto the skin, so the pressure is reduced and the person does not complain of pain.

TREATMENT:

1. Take out the tooth (see Chapter 11).
2. Give penicillin for 5 days (see page 88).
3. After the penicillin treatment, check the sore. If it has healed, there is no longer infection inside. The treatment is finished.

But if the sore is still open and you can squeeze out pus, you will need the help of experienced health workers who can:

- test the pus to see if it is resistant to penicillin. The person may need to take a different antibiotic.
- take an X-ray to see if there are dead pieces of bone which are keeping the infection alive. If there are, they must be removed.

If infected gums (and not a bad tooth) are the cause of a sore on the cheek or chin, the problem is more serious. See the next 4 pages.
NOMA

When a child is sick, a simple gum infection can get out of control and spread through the cheek to the face. When that happens the condition is called Noma or Cancrum Oris. Noma is a complication of Vincent's Infection of the gums (page 96).

You will usually see noma in children. It will only develop if these 3 things are true:

1. The child's general resistance is low. Usually, he is undernourished and anemic (lacks iron). He may have tuberculosis.
2. The child has Vincent's Infection.
3. The child has recently had a serious illness like measles or malaria.

SIGNS:

The infection starts in the mouth.

Then it passes to the gums.

1. Sore mouth with itching gums.
2. Swollen, sore gums.
3. Gums bleed when eating or when teeth are cleaned.
4. Bad breath, spits a lot.

Then it reaches the jaw.

5. Loose teeth.
6. Loose pieces of bone around the teeth.

Finally, it affects the cheek.

7. Skin is tight with dark red swelling.
8. Black spot on the cheek breaks open, leaving a hole into the mouth.
9. A line separates dead tissue from healthy tissue.
TREATMENT:

You must start treatment for noma immediately in order to prevent the hole from getting bigger. The bigger the hole, the tighter the scar that forms after you close the hole. A tight scar will prevent the child from opening his mouth and chewing the food he needs to grow stronger.

1. Give fluids.

The child needs to overcome both the lack of body water (dehydration) and his lack of resistance to disease.

Start giving the Milk-oil drink described on p. 105.

If he cannot drink by himself, help him. Use a spoon or syringe.

Place the fluid on the inside of the healthy cheek and ask the child to swallow.

2. Treat the anemia.

Start giving iron now. The child should continue taking the tablets or mixture for 3 months.

<table>
<thead>
<tr>
<th>Ferric Ammonium Citrate Mixture</th>
<th>OR</th>
<th>Ferrous Sulfate Tablets (200 mg.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>over 6 years: 1 1/2 ml. (30 drops) daily</td>
<td>200 mg. (1 tab) 3 times a day</td>
<td></td>
</tr>
<tr>
<td>3-6 years: 1 ml. (20 drops) daily</td>
<td>100 mg. (1/2 tab) 3 times a day</td>
<td></td>
</tr>
<tr>
<td>under 3 years: 1/2 ml. (10 drops) daily</td>
<td>50 mg. (1/4 tab) 3 times a day</td>
<td></td>
</tr>
</tbody>
</table>

Also give food rich in iron: meat, fish, eggs, dark green leafy vegetables, peas and beans.

Note: a child may have anemia because he has hookworm. It is wise not to wait for a test for hookworm. Begin now giving hookworm medicine such as thiabendazole and folic acid (see Where There Is No Doctor, pages 142, 363, and 376).
3. Start antibiotics.

Penicillin is the best antibiotic to use. As the child may not be able to swallow pills easily, it is best to start with penicillin injections (page 166).

If you do not have penicillin, you can give sulfadimidine 4 times a day. It comes in 500 mg. tablets or in syrup that has 500 mg. in 5 ml. To decide how much to give, weigh the child.

<table>
<thead>
<tr>

<td>1 1/2 tablet or 1 1/2 teaspoon of syrup</td>
</tr>
<tr>
<td>over 25 kg.</td>
<td>2 tablets or 2 teaspoons of syrup</td>
</tr>
</tbody>
</table>

4. Treat the other illness that helped noma to develop.

It is wise to assume that the child has malaria and to begin treating with antimalarial drugs (see Where There Is No Doctor, pages 357 and 358).

Look for any other illnesses and treat them, too.

5. Clean the sore.

Gently pull away any dead skin with tweezers. Wash the inside of the sore with hydrogen peroxide. (Be sure you measure the hydrogen peroxide carefully. See page 8.) Then put in a wet dressing.

*The dressing:*

- Soak cotton gauze in salt water. Squeeze out the extra water so that it is damp but not wet.
- Put it in the hole and cover it with a dry bandage.
- Every day, remove the bandage, wash the hole with hydrogen peroxide, and put in a new dressing. Do this until the hole does not smell anymore and there is no more dark dead skin.

6. Remove the loose teeth and dead bone.

You can use a local anesthetic (Chapter 9). Usually there is not much bleeding. If gums are loose, join them with a suture (see pages 155-157).
7. Keep the mouth clean.

- Use a soft brush gently to clean the remaining teeth. Do this 3 times a day for the child.
- Wipe the gums with a weak solution of hydrogen peroxide. Use cotton gauze that is damp with the solution. Do this every 2 hours for 5 days.
- Then after 5 days, start rinsing with warm salt water 3 cups a day.

8. Get advice on whether surgery is needed.

Unfortunately, the child will probably need surgery, to release the scar. Without this surgery, the child will not be able to open his mouth properly.

Send the child for medical help when the infection is finished and the wound starts to close.

You may also need a dentist’s help at this time. The child’s jaws may need to be wired. The wires are put on the healthy teeth in a way that holds the mouth open while the tight scar is forming. When the wires are removed, the child will be able to open and close his mouth to chew food.

PREVENTION of Noma:

Noma need not occur. We can prevent it. Always give special attention to the mouth of a sick child, to be sure to keep his teeth clean.

Whenever someone is nursing or caring for a sick child, that person should clean the child’s teeth as a normal activity. This is especially true for a child who is weak, undernourished, and with little body water (dehydration).

Such a child should always:

1. have his teeth carefully cleaned each day with a soft brush.
2. rinse his mouth with a warm salt water solution (page 7), 2 times a day.
3. eat fresh fruits and vegetables, especially the kind that have Vitamin C—guavas, oranges, pineapples, papayas, tomatoes, peas, and dark green leaves.
TUMOR

A tumor is a lump that grows under the skin or inside the bone. It grows slowly but steadily, usually without any pain.

If the swelling does not get better after 5 days of antibiotics and heat treatment (page 88), it may be a tumor.

TREATMENT:

Do not waste any more medicine or any more time. A tumor may be cancer. Send for medical help. Surgery is needed to remove a tumor.

CANCER

Any sore that does not heal may be cancer. The lips and tongue are the two places in the mouth where cancer starts most often.

Cancer is deadly.

Medicine cannot help. It wastes time to use it.

Cancer can spread quickly to the inside of the person’s body where you cannot see it. This can lead to the person’s death.

TREATMENT:

Whenever you treat a sore and it does not get better, send the person for medical help immediately. A doctor can cut out a piece from the sore, look at it under a microscope, and decide if it is cancer.
Scaling means 'scraping away'. You can scale old food, tartar, or even a fish bone caught under the gum. You usually scale teeth to remove tartar.

We get tartar when the coating of germs on our teeth (p. 48) becomes hard.

Gums that press against tartar become sore and infected.

Clean teeth keep our gums healthy. Scaling a person’s teeth gives infected gums a chance to become normal again.

However, **gums remain healthy only when we keep the teeth beside them clean.** If we are not careful about cleaning our teeth after they are scaled, tartar will soon return. Instead of being healthy, the gums will become sore and infected again.

**Scale a person’s teeth, but also teach how to keep teeth clean.**

You must remove something caught under the gums (page 127) before it causes more pain and swelling. Remove a piece of fish bone or piece of mango string now.

If the person has a mild gum problem (gums that bleed), wait a week or so before scaling. If the person uses this time to clean his teeth better and to rinse with warm salt water (page 7), the gums will improve. The person’s teeth will be easier for you to scale, and he will learn that he can do much by himself to care for the gums.

**Use a mirror to show the person gum infection inside his own mouth.** Later he can see the improvement he has made. He can learn about how to keep gums healthy as he follows his own progress.

**Scale a person’s teeth only when he really wants to try to keep them clean.** If he does not want to clean his teeth, the tartar will soon return. Do not waste your time scaling the teeth of a person who does not want to learn.
THE INSTRUMENTS YOU NEED FOR SCALING

We scale teeth with special instruments called scalers. There are many different kinds of scalers for different teeth, to make scaling easier. It can be a problem to know which ones to buy.

Scalers are expensive instruments. For that reason, it is better to order only a few instruments that you can use to clean most teeth.

You need only 2 double-ended scalers, or 4 single-ended scalers.

For instance:

1. **One with two pointed tips**—to remove tartar from the part of the tooth **near** the gum.

   ![Double-ended scaler](image)

   Its proper name is *Ivory C-1 scaler*.

2. **Another with two blunt, rounded ends**—to remove tartar from the part of the tooth **under** the gum.

   ![Single-ended scaler](image)

   Its proper name is *G-11 and 12 curette*.

The ends of the scaler are the important parts. One end is bent to the left and the other end is bent to the right, so you can reach more easily around all sides of the tooth.

The blade at each end of the scaler is sharp. You must keep the blade sharp. A sharp blade can break more of the tartar away than a blunt blade.

You also need these:

- **Mirror**
- **Probe** *(explorer)*
- **Tweezers** *(cotton pliers)*
- **Sharpening stone** *(Arkansas stone)*

Note: When you order an instrument, use both its common and proper name. Then you have a better chance of receiving the instrument you want. You can also make some of your own instruments. See pages 170-172.

**Keep everything in a Scaling Kit.**
HOW TO SCALE TEETH

Tartar starts to form inside the gum pocket. There it builds up, because the gums protect it. So you often must feel rather than see the tartar when you scale a tooth.

You must remove all of the tartar so the gums can heal. **New tartar grows faster when there is old tartar left behind for it to build upon.**

Lay out what you need ahead of time.

- your instruments: scalers, mirror, probe, tweezers
- sharpening stone
- cotton gauze

Your light must be good enough to see the tooth and gums around it clearly. Scaling teeth requires time and practice. Make yourself and the person comfortable. You can sit next to a special chair that lets the person lean back (see page 73).

<table>
<thead>
<tr>
<th>The steps in scaling teeth are these (pages 123-127):</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Explain to the person what you are going to do.</td>
</tr>
<tr>
<td>2. Feel under the gum for rough spots (tartar).</td>
</tr>
<tr>
<td>3. Place the scaler under the tartar.</td>
</tr>
<tr>
<td>4. Pull the scaler against the side of the tooth.</td>
</tr>
<tr>
<td>5. Check to be sure the tooth is smooth.</td>
</tr>
<tr>
<td>6. Explain what you have done and what the person should now do.</td>
</tr>
</tbody>
</table>

1. **Explain what you are going to do.** Tell the person what to expect. There will be some bleeding and possibly some pain. However, you can stop and rest, or inject local anesthetic, if it is painful. **Remember:** first wash your hands and your instruments! (See pages 82-85.)

2. **Feel under the gum for tartar.** Tartar feels like a rough spot on the root of the tooth. Since tartar can form anywhere inside the gum pocket, feel for it on all sides of the tooth.

You can check for tartar two ways.

1. **Use your probe.** Slide the point up and down along the root surface under the gum. Feel for places that are rough. Teeth without tartar are smooth.

2. **Use cotton gauze.** Twist a corner and press it between the teeth. The gauze lowers the gum and soaks up the spit. You can then see more tartar.
3. **Place the scaler under the tartar.** You must learn two important things: how to hold the scaler and how to slide the scaler into the gum pocket.

Hold the scaler almost as you would hold a pen. You can then pull it against the tartar with both power and control.

**Control is very important.** The ends of the scalers are sharp. If you are not careful, the blades can cut the gums. Be gently and do not hurry. Always hold the tip of the scaler on the tooth to avoid poking the gums.

Rest your 3rd finger against a tooth. This will steady your hand and let you slide the sharp scaler under the gum with care.

---

**FOR AN UPPER TOOTH**

**FOR A LOWER TOOTH**
The edge of the gum, near the tooth, folds under to form a pocket. This **gum pocket** goes completely around each tooth. The gum pocket can be shallow or deep. A deep pocket means there has been an infection for a while.

![Diagram of gum pockets and tartar](image)

Tartar starts forming deep inside the gum pocket. If you remove tartar that you can see above the gum, it is helpful, but not good enough. You must remove the rest of the tartar, or the infection will continue. If part of the tartar stays on the tooth, the infection will continue.

**First,** use the pointed-tip scaler to remove the tartar that you can see.

**Then,** go back with your rounded-tip scaler and scrape away the remaining tartar.

**Be careful when you place the rounded end of the scaler inside the gum pocket.**

1. Put the sharp face of the blade against the tooth. Slide it along the tooth down into the gum pocket.

2. You can feel the edge as it goes over the rough tartar. Stop when you feel the bottom of the gum pocket.
4. Hold the end tight against the side of the tooth and pull the scaler. Try to break free as much tartar as possible at once. It is a bad idea to remove the tartar a bit at a time, because the remaining tartar becomes smooth and harder to scrape away.

<table>
<thead>
<tr>
<th>1. Tighten your fingers on the scaler.</th>
<th>2. Pull the scaler with a firm short stroke.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ALWAYS KEEP THE TIP OF THE SCALER ON THE TOOTH—NOT POKING THE GUM.</strong></td>
<td></td>
</tr>
<tr>
<td>3. Wipe the end of the scaler with cotton gauze.</td>
<td>4. Press against the gums to stop the bleeding.</td>
</tr>
</tbody>
</table>

5. Check to be sure the tooth is smooth.

With your probe, feel under the gum for any place that is still rough.

When all the sides of the tooth feel smooth, move to the next tooth.

Do not hurry. It is more important to take your time and carefully remove all the tartar. If the person has a lot of tartar, scale only half the mouth now. Do the other half on another day, as soon as the person can return.

**Finally, make the tooth look clean.** Use the sharp edge of either scaler. Scrape away the dark material on the front and back sides of the tooth.

The tooth itself has not turned dark. It is just a stain. People most often get these stains when they eat meat, drink tea or smoke tobacco.

You can scrape away this old food and uncover the white tooth. **But remember:** the teeth will turn dark again if not cleaned carefully every day.
6. **Talk to the person about what you have done and what to expect.** The gums will be sore for the next few days. That is normal.

Then explain to the person what to do to make the gums strong and tough again.

A. **Clean your teeth better with a soft brush.** Reach with the brush into the gum pocket, and behind your front teeth. That is where tartar collects most often (page 67).

B. **Clean between your teeth.** Use your brush, the stem from a palm leaf, or a piece of strong, thin thread (page 69).

C. **Rinse your mouth with warm salt water.** Start with 4 cups a day, to make the gums strong. Then use 1 cup a day to keep them strong (page 7).

D. **Eat local foods that give strength to gums.** Fresh fruits like guava and oranges, and fresh vegetables with dark green leaves are good for the gums.

**REMOVING SOMETHING FROM UNDER THE GUM**

If the gum between two teeth is red and swollen, something may be caught inside the gum pocket. Ask what the person has been eating. The object may be a fish bone, mango string, or a sharp piece of tartar.

First try to feel the object with your probe. Then remove it using a scaler or a piece of strong thread.

- Use the rounded-tip scaler in the same way as you would to remove tartar. ———

- Feel the object, go under it gently, and then lift it out.

- Tie a knot in a piece of thread. Then slide the thread between 2 teeth (page 69).

However, do not move the thread up and down. Instead, pull it and the knot out the side. The knot can pull the object out with it.*

*If the gum has grown into a kind of tumor (*epulis*), an experienced dental worker should cut it away.
KEEP YOUR SCALING INSTRUMENTS  
SHARP AND CLEAN

A sharp scaler bites into tartar better than a blunt one. Sharpen the edge whenever you feel it sliding over the tartar.

From time to time, feel the cutting edge to be sure it is sharp.

Scrape it against your fingernail. If the cutting edge is not able to cut your nail, it will not be sharp enough to break the tartar free.

Sharpen the cutting edge of the scaler on a fine-grain stone (Arkansas stone). Put a few drops of oil or water on the stone first, so the scaler can slide against it more easily.

Rest your 2nd or 3rd finger against the side of the stone. This is for control.

Rub the cutting edge against the stone. Move it back and forth.

Turn the round scaler as you sharpen it. This helps to keep the scaler’s round shape.

Scalers must be more than clean—they must be sterile. This is because there may be spots of blood on them. Hepatitis (Where There Is No Doctor, page 172) can pass from the blood of one person to the blood of another person. To learn how to sterilize, see pages 83 and 84.

Your mirror, probe, and cotton tweezers do not need sterilization. A disinfectant (see page 85) will clean them. Dry all the instruments with a towel. Then wrap them inside a clean cloth and put them in your scaling kit. They are now ready for use whenever you need them again.

Remind each person: scaling is not a cure. Rather it is a way of giving her a new start. Only she can give herself the care she needs to keep her gums healthy. You have removed the hard material from her teeth, and if she brushes carefully, the tartar will not return!
Injecting Inside the Mouth

It is possible to treat a tooth without pain. You do this with an injection of local anesthetic. You must inject near the nerve, so to give good injections, you must know where the nerves are.

Injecting is a skill that develops with experience. The best way to learn is not from a book, but from a person who has experience giving injections.

Watch an experienced dental worker give injections. That person can then watch you and show you how to inject carefully and safely.

Local anesthetic is an injectable medicine. When it touches a nerve, the tooth joined to that nerve feels numb or dead for about an hour. This usually gives you enough time to take out a strong tooth or to put a cement filling into a deep cavity.

WHAT YOU NEED TO INJECT

There are two kinds of syringes for injecting local anesthetic inside the mouth. One is made of metal and the other is made of glass. The metal syringe uses local anesthetic in a cartridge. The glass syringe uses local anesthetic from a bottle.

**METAL SYRINGE**

This is a dental syringe. It uses special needles, and the local anesthetic is sealed inside a glass cartridge. You must throw away both needle and cartridge after injecting.

1. **before you inject,**
   be sure the local anesthetic is able to come out of the needle.

2. **Use a new needle and a new cartridge of local anesthetic for each person.**

**GLASS SYRINGE**

This kind of syringe is for injections of medicine like penicillin, but you can use it in the mouth. Boil the syringe and needles (p. 84) before and after each use. When sterile, the needles are ready for another person.

1. **Be careful! Do not touch the needle.**
Your choice of which syringe to use depends on the local anesthetic you can get. Order needles to fit your particular kind of syringe.

<table>
<thead>
<tr>
<th>METAL SYRINGE</th>
<th>GLASS SYRINGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order:</td>
<td>Order:</td>
</tr>
<tr>
<td>1. syringe: aspirating dental cartridge syringe, 1.8 ml (1 ml = 1 cc)</td>
<td>1. syringe: standard glass syringe that holds around 3 ml (1 ml = 1 cc)</td>
</tr>
<tr>
<td>2. needles: disposable needles for dental cartridge syringe (27 gauge, long) One box contains 100 needles, each one inside a plastic cover</td>
<td>2. needles: 24 gauge, long (40 mm x .56 mm or similar)</td>
</tr>
<tr>
<td>3. local anesthetic: local anesthetic cartridges for a dental syringe One sealed tin contains 50 cartridges of lidocaine (lignocaine) 2%</td>
<td>3. local anesthetic: 20 ml bottle of lidocaine (lignocaine) 2% Or, if not available: order 2 ml ampules of procaine hydrochloride 1%</td>
</tr>
</tbody>
</table>

**NOTE:** Lidocaine will keep the teeth numb longer if there is **epinephrine** in it. But this is more expensive, and you should not use it on persons with heart problems (see the bottom of the next page).

**WHERE TO INJECT**

You can deaden a nerve with an injection of local anesthetic:

1. near the **small nerve branch** going inside the root of a tooth.
2. near the **main nerve trunk** before it divides into small branches.

Smaller nerves ‘branch’ off from the main nerve—much like branches of a tree leave its main trunk.

One small nerve then goes to each root of every tooth.

**Inject an upper tooth near its roots.**

Bone in the upper jaw is soft and spongy.

Local anesthetic placed near the root of an upper tooth can go inside the bone and reach its nerve easily.

The same injection also makes the gums around that side of the tooth numb.
It is more difficult to inject the lower teeth.

The lower jaw bone is thicker. When you inject near the roots of a lower tooth, the anesthetic is not able to reach its nerve as easily.

*Note:* You can inject lower front teeth in young children, or very loose lower front teeth in adults, near their roots.

**To make a lower tooth completely numb,** you must block the main nerve (a) before it goes inside the jaw bone.

These two injections also make the gums around the teeth numb.

If you are treating a back tooth, you must give a second injection for nerve (b). See page 134.

**WHEN TO INJECT**

Inject local anesthetic whenever the treatment you give may hurt the person. If, after you inject, the person says the tooth still hurts, be kind. Stop and inject again.

Inject local anesthetic slowly and carefully. You can then treat a bad tooth and not hurt the person.

**HOW TO INJECT***

For a good, safe injection, remember these 5 things!

1. Do not inject local anesthetic into an area that is swollen. This can spread the infection. Also, pus inside the swelling stops the local anesthetic from working properly. Instead, treat the swelling first (page 88) and take out the tooth later.

2. If the person has a heart problem, do not inject more than 2 times in one visit. Also, it is best not to use an anesthetic with epinephrine on persons with heart problems. Use lidocaine only, or mepivacaine 3%.

*Local anesthetics are the only injections given in the mouth. To learn about injecting antibiotics, see page 166.
3. Before you push the needle under the skin, be sure its pointed end is facing in the correct direction. 

![Correct Direction Diagram]

The local anesthetic must come out against the bone, where the nerve is.

![Incorrect Direction Diagram]

4. Before you inject the local anesthetic, wait a moment to see if any blood enters the syringe. (Note: only an aspirating syringe will do this.)

![Aspirating Syringe Diagram]

Pull back on the plunger. If blood comes inside, it means you have poked a blood vessel. Pull the needle part way out and gently move it over to a different place.

If you inject local anesthetic into the blood vessel, there will be more swelling afterward, and the person may faint. If the person faints:
- Lie him on his back.
- Loosen his shirt collar.
- Lift his legs so they are higher than his head.

5. Be sure your syringe and needles are clean and sterile (see pages 82 to 85). Do not pass an infection from one person to another by using dirty needles.

**FOR GLASS SYRINGES:**
Boil the syringe and needle in water (page 84) for 20 minutes in a covered pot. Although it is not as important, it is also a good practice to boil your metal syringe.

**FOR METAL SYRINGES:**
- Use a new cartridge for each person who needs an injection. Do not use local anesthetic from a cartridge that you have used on another person.
- Break the disposable needle after using it. Then cover the point with its plastic top and throw the needle into the trash.
Injecting the Upper Teeth

Inject local anesthetic near the root of the tooth you want to treat.
Front teeth have one root. Back teeth have more than one.

For a tooth to become completely numb, the local anesthetic must touch the small nerve going to each one of its roots.

1. First decide where to inject.
   Lift the lip or cheek. See the line that forms when it joins the gum.

   The needle enters at the line where the lip or cheek meets the gum.

2. Push the needle in, aiming at the root of the tooth. Stop when the needle hits bone. Inject about 1 ml. of local anesthetic (1/2 of a cartridge).

   Pull the needle part way out and move it over to the next root. Inject again.

If the tooth is to be taken out, leave 1/4 ml. for the next step.

3. If you are taking out a tooth, also inject the gums on the inside.
   Ask the person to open wide. Inject the remaining anesthetic (1/4 ml) directly behind the back tooth that must come out.
   
   One injection can numb the gum behind the 6 front teeth. Inject into the lump of gum behind the middle front teeth. (Note: This injection hurts! It may help to use 'pressure anesthesia'. See p. 135.)

4. Wait 5 minutes for the tooth to become numb.
Injecting the Lower Teeth

When you block the nerve, it affects all of the teeth as well as gums on that side. However, it takes practice to do this successfully. **Ask an experienced dental worker to help you learn how to give this injection properly.**

Stand in such a way that you can see clearly where you need to inject. Ask the person to open wide.

1. **First feel for the place to be injected.**
   Put your thumb beside the last molar tooth. (Wash your hands first! See p. 82.) Feel the jawbone as it turns up towards the head. Rest your thumb in the depression there.

2. **Press against the skin with the end of your thumb.**
   The skin forms a 'v' shape. Your needle must go into the 'v'.

   Hold the syringe on top of tooth number 4 and aim the needle at the 'v'.

   Push the needle in until it hits the jawbone, (about 3/4 of the length of a long needle). Pull back on the plunger of the aspirating syringe to check for blood (page 132).

   Inject 1½ ml of local anesthetic (3/4 of a cartridge).

**Try to feel your way:** If you hit bone too early, pull the needle part way out and move it over so that it points more toward the back of the mouth. Try again.

If you do not hit bone, the needle is too far back. Pull it part way out, and point it more toward the front. Push it in again.
3. Give a second injection BESIDE the back teeth.

If you are going to fill or remove a back tooth, inject beside that tooth, where the cheek joins the gum.

Inject 1/2 ml of local anesthetic (1/4 of a cartridge).

This injection is not needed for front teeth.
It is enough to block the main nerve.

4. Wait 5 minutes for the tooth to become numb.

Take time with children

1. Put some topical anesthetic on the gum before you inject. But be sure the gums are dry in that place. If you wipe the gum with cotton, the topical anesthetic will stay on longer. Give the anesthetic time to work: wait a minute before injecting.

If you do not have topical anesthetic, try using pressure. You can use 'pressure anesthesia' whenever you have to give an injection in a sensitive place, like the roof of the mouth.

Wind some cotton around the end of a matchstick. Press firmly for a minute behind the bad tooth. Then inject quickly into the depression that formed where you pressed.

2. Be sure the anesthetic is warm when you inject it. Hold the cartridge or bottle in your hands for a few minutes before you use it.

3. Use a new, sharp needle.

4. Have someone pass you the syringe out of sight of the child. Then the child will not have to look at it and be frightened.

5. Be ready to stop the child from grabbing the syringe.

6. Inject the anesthetic slowly. Do not hurry. A too-quick injection can cause sudden pressure, which hurts and frightens the child.
AFTER YOU GIVE AN INJECTION

**Before you begin treatment**, test the tooth and gums to be sure that they are numb. Wait 5 minutes for the anesthetic to start working. Ask the person how his lips feel—they should feel 'heavy' or numb. Then test the area.

Poke the gums between the teeth with a clean probe.

Watch the person's eyes—you will see if you are hurting. If the person still feels pain, stop. Think about your injection technique, and inject again.

**After you finish treatment**, always talk to the person about what you have done. Tell the person what to expect, and how to be careful with the numb area of the mouth:

- The area will feel normal again in about 1 hour.
- Do not bite or scratch the area while there is no feeling.
- Do not drink anything hot. It can burn the skin inside the mouth.

**With a child**, always place a ball of cotton between the teeth on the side where you injected. The child should leave it there for 2 hours, until the area feels normal again. Tell Mother that, and give her a bit of extra cotton to take home. It is much better for the child to chew cotton instead of the numb lip or cheek!

Try not to hurt anyone. You can treat a bad tooth easier, faster, and without pain if you inject local anesthetic slowly and carefully into the right place.
Cement Fillings

When someone’s tooth hurts, you do not always need to take it out. There may be a way to treat it and keep it. Always ask yourself whether a bad tooth really needs to come out.

This chapter is about filling cavities. Cavities are the holes that tooth decay makes in the teeth.

From this chapter, you can learn:
- When to fill the cavity, or when to take out the tooth
- How to place a temporary filling.

WHEN NOT TO PLACE A FILLING

Do not fill a cavity if you think there is an abscess in the tooth. Look for these signs of an abscess:

- The face is swollen.
- There is a gum bubble (p. 72) near the root of the tooth.
- The tooth hurts constantly, even when the person tries to sleep.
- The tooth hurts sharply when you tap it.

An abscess occurs when germs from tooth decay start an infection on the inside of the tooth. If you cover up an abscess with filling material, it will make the problem worse. Pressure builds up inside the filled tooth, causing even more pain and swelling.

If a tooth has an abscess, take it out (see the next chapter), unless you can give special nerve treatment (root canal treatment).
WHEN TO PLACE A FILLING

You can fill a cavity if the tooth does not have an abscess. There is not yet an abscess if:

- there is no swelling of the face or gums near the bad tooth.
- the tooth hurts only once in a while—for example, if it hurts only after food or drink, or when breathing cold air. probably no abscess.
- the tooth feels the same as the others when you tap against it.

The decay is deep enough for the nerve to feel temperature changes, but not near enough to the nerve to be infected. So there is not an abscess. You can save the tooth by filling the cavity as soon as possible.

What a Filling Can Do

A filling can help a person in three ways:

- It stops food, air, and water from entering the cavity. This will stop much discomfort and pain.
- It stops the decay from growing deeper. This can prevent a tooth abscess.
- It can save the tooth, so the person can use it for many more years.

TWO KINDS OF FILLINGS

A permanent filling is made to last for many years. To place one requires special equipment and skills. An experienced dental worker can shape the cavity with a dental drill so it can hold the filling material better (see pages 145-146).

A cement filling is a temporary filling. It is meant to last only for a few months. It helps the person feel more comfortable until it is possible to get a permanent filling.

Replace a temporary filling with a permanent filling as soon as possible.

This chapter shows how to place cement fillings only, for most readers do not have the expensive equipment needed to make permanent fillings. But remember that many people can benefit from the extra time that a temporary filling gives them before they get a permanent filling.

A cement filling is often the first step to saving a tooth.
THE INSTRUMENTS AND FILLING MATERIAL YOU NEED

In many places, government medical stores can provide most of the instruments as well as cement filling material. If this is not possible, a dentist may be able to help you to order what you need.

**Instruments**

Most dental instruments look alike, but the small end of each instrument is shaped to do a special task. Try to get instruments similar to these and keep them in a kit.

![mirror](image)  ![probe](image)  ![tweezers](image)  ![spoon](image)  ![filling tool](image)  ![mixing tool](image)

*mirror*  *probe*  *tweezers*  *spoon*  *filling tool*  *mixing tool*

(explorer)  (cotton pliers)  (spoon excavator)  (filling instrument)  (cement spatula)

Some instruments have more than one name. The second one, in (), is the proper name. Use the proper name when you order.

**Cement Filling Material**

Many companies make temporary filling material. The names on the packages are different. This makes it hard to know which one to order.

However, the basic material of each product is the same—zinc oxide and oil of cloves (eugenol). To save money, order these two main ingredients in bulk, instead of an expensive kind of cement filling material.

![Oil of cloves](image)  ![Zinc oxide](image)

Oil of cloves is a liquid.  Zinc oxide is a powder.

You may be able to buy a special kind of zinc oxide powder called **I.R.M.** (Intermediate Restorative Material). Fillings with I.R.M. are stronger and harder, so they last longer. But it is more expensive than zinc oxide.
HOW TO PLACE THE CEMENT FILLING

Lay out on a clean cloth:

- your syringe, needle, and local anesthetic (in case a tooth hurts)
- oil of cloves (eugenol) and zinc oxide
- lots of cotton: cotton rolls, gauze, or cotton wool
- smooth glass to mix cement

To place a cement filling, follow these 6 steps (pages 140-144):

1. Keep the cavity dry.
2. Lift out some, but not all, of the soft decay. (If the tooth hurts, inject local anesthetic.)
3. Mix the cement.
4. Press the cement into the cavity.
5. Remove the extra cement from around the cavity and the tooth.
6. Explain things to the person.

1. Keep the cavity dry. The cavity and the area around it must be dry so you can see what you are doing. Just as important, cement stays longer inside a dry cavity.

Place cotton between the cheek and gums to keep the area dry. Put some cotton under the tongue when you work on a lower tooth.

Use whatever kind of cotton you have: gauze, wool, or even rolls.

Change the cotton whenever it becomes wet.

Keep the cavity dry while you work. Wipe the inside of it every now and then with a bit of cotton.

Then leave a piece of cotton inside the cavity while you mix the cement.
2. **Lift out some of the decay.** You do not need to remove all of the decay on the bottom of the cavity. You can leave some, as long as you cover it with cement. If you try to dig out all of the decay, you might touch the nerve. Try to cover the decay so it stops growing.

   **However, you must remove all of the decay from the edge of the cavity.** Otherwise, germs and food can go between the cement and the cavity and keep the decay growing inside.

   Scrape clean the walls and the edge of the cavity. If you find that the edge is thin and weak, break it deliberately with the end of your instrument. That makes for stronger sides to hold onto the cement.

   Use the spoon tool and lift out soft decay from inside the cavity. Do not go too deep. Make the cavity just deep enough to give thickness and strength to the cement. **If the tooth hurts when you do this, stop and inject some local anesthetic.** Use cotton gauze to collect the bits of decay so that the person does not swallow them.

   Use your mirror and look closely around the edges of the cavity for decay that you may have missed. Put some cotton inside the cavity and leave it there while you mix the cement.

3. **Mix the cement** on a piece of smooth glass. Place separately onto the glass a pile of zinc oxide powder and a few drops of eugenol liquid.

   Pull a small amount of the powder to the liquid with the mixing tool and mix them together. Add more powder in this way, until the cement mixture becomes thick.

   **Suggestion:** Practice with the cement ahead of time. You can then find out the time it takes to become hard.
Cement is much easier to use when it is thick and not too sticky. Roll a bit between your fingers. If the cement sticks, it is not yet ready. Add more powder and then test again.

Now take the cotton out of the cavity. Check to be sure the cavity is dry. If the cotton around the tooth is wet, change it.

4. Press some cement into the cavity. Put a small ball of cement on the end of your filling tool. Carry it to the cavity. Spread it over the floor of the cavity and into the corners.

Then add another ball of cement, pressing it against the other cement and against the sides of the cavity.

Remember: Decay stops growing only when the cement covers it completely and tightly.

Keep adding cement until the cavity is over-filled. Smooth the extra cement against the edge of the cavity.

If a cavity goes down between two teeth, one other step is necessary. You need to take care that the cement does not squeeze and hurt the gum.

Before you spread the cement, place something thin between the teeth.

You can use the soft stem from a palm leaf, a toothpick, or a tooth from a comb. Be sure it has a rounded end to prevent damage to the gums.
5. **Remove the extra cement before it gets too hard.** Press the flat side of the filling tool against the cement and smooth it towards the edge of the cavity.

As you smooth the cement, shape it to look like the top of a normal tooth.

This way, the tooth above or below it can fit against the filling without breaking it.

After you take out the stem or toothpick (p. 142), smooth the cement. **Gums stay healthier when the cement beside them is smooth.**

Cement that sticks out and is not smooth can hurt the gums. It can also later break off. When that happens, spit and germs are able to go inside and start the decay growing again.

**It is also important to look closely around the tooth for loose pieces of cement and to remove them before they make the gums sore.**

Use the end of your probe. Gently reach into the gum pocket and lift out any pieces of cement caught there.

Wipe off your probe with cotton gauze each time.

Now remove all the cotton and ask the person to gently close the teeth. The teeth should come together normally and not hit first against the cement filling. **Too much pressure against the cement filling will crack and break it.**

Always check to see if part of the filling is high:

1. If the cement is still wet, you can see the smooth place where the opposite tooth bit into it. Scrape the cement away from this place.
2. If the cement is dry, have the person bite on a piece of carbon paper. If there is too much cement, the carbon paper will darken the cement. Scrape away that extra cement. If you have no carbon paper, darken some paper with a pencil.

**The person must not leave your clinic until the filled tooth fits properly against the other teeth.**
6. Explain things to the person. Explain how to look after the filling so it will not break:

- Do not eat anything for 1 hour—let the cement get hard and strong.

- Try not to use that tooth for biting or chewing. Until there is a permanent filling, the cement and sides of the cavity are weak. They cannot take much pressure.

If the tooth hurts more after you place the cement filling, there is probably an abscess. Take out the tooth. If you cannot take out the tooth immediately because of swelling, take out the filling to relieve the pressure, and take out the tooth after you treat the swelling (p. 87).

CLEAN YOUR INSTRUMENTS AFTER YOU FINISH

You do not need to boil your cement filling instruments. In fact, boiling can weaken the small pointed ends.

First scrape the dried cement from the filling and mixing tools. Then, after you scrub them with soap and water, leave them for 20 minutes in disinfectant (see page 85). Finally wrap the instruments together in a clean cloth so they are ready for use when you need them again.

REMEMBER: A cement filling is only a temporary measure. A good one can last up to 6 months. During this time, the person must see a dental worker who has the equipment to put in a permanent filling. For this, the person may have to travel to the city, or wait for the dental worker to visit your area.
ABOUT PERMANENT FILLINGS

This chapter has shown how to place a temporary filling. Remember that within a few months, the person needs to replace this filling with a permanent one. This book does not give full instructions for placing permanent fillings, because most readers of the book cannot buy the dental drill needed to make them. In a later book, we hope to give not only instructions for placing a permanent filling, but also ideas for constructing simple dental drills using low-cost local resources.

Some Simple Dental Drills

We use a dental drill to remove all decay from a cavity and to change the shape of the hole in the tooth so it can firmly hold the permanent filling material. The most expensive drills use electricity, but some drills are powered by people instead of electricity.

Village dental workers in the mountains of western Mexico use bicycle power to make compressed air, which runs a high-speed drill.

Local young people or family members volunteer to pump the air while they wait to have their own teeth fixed.

In India and Guatemala, health workers use a foot treadle to power a drill, the same way they operate a sewing machine. This kind of drill is slower than a compressed-air drill, and the grinding produces a lot of heat, so one must take care not to let the tooth get so hot that it kills the nerves (see p. 146). Still, this is one of the simplest and cheapest ways to place a permanent filling.

There are many other excellent ideas for simple, low-cost dental drills. Some are lightweight, so you can carry them to remote areas. Please write to the Hesperian Foundation if you know of a design for a low-cost drill. We will use these ideas in the next book. We also will answer letters from those interested in ways to make or buy inexpensive drilling equipment.*

*Some simple but strong portable equipment has been made for use in remote areas by the National School of Dental Therapy, 710 - 15th Ave. E., Prince Albert, Saskatchewan S6V 7A4, Canada.
How a Dental Drill Works

Even if you have the equipment, it is essential that you learn how to make permanent fillings from a person who has experience using a dental drill.

The tip of the drill (drill bit) is sharp. The ones powered by compressed air move at high speed, which makes it easier to dig out all of the decay and shape the hole. Some drills spray water on the tooth to keep it cool. Cooling is especially important with a slower treadle-powered drill. An assistant can spray water on the tooth if the drill does not have a sprayer.

As the drill bit moves slowly back and forth, it opens the cavity further. This makes it easier to see all of the decay. The decay is later removed with a spoon instrument. (p. 139).

The drill bit also changes the shape of the cavity. The hole in the tooth is shaped so that it will keep the permanent filling material in place.

When all of the decay is removed, the dental worker will place a paste containing calcium hydroxide into the deepest part of the cavity. This paste helps to separate the final filling from the nerve, so the filling will not cause pain.

The filling material, which is made of metal or plastic, must be very strong. It must not break apart when the person chews food or when saliva washes over it.

Unfortunately, the best kinds of filling material often require special instruments to prepare and place them in the cavity.
Taking Out a Tooth

Not every painful tooth needs to come out. Sometimes it is possible to prevent such a final step. You must decide how serious the problem is, and then decide if you can treat and save the tooth. Some problems—such as root canal treatment for a tooth with an abscess, or wiring for a loose tooth—require the skills of an experienced dental worker. Even if you cannot treat every person, a more experienced worker can help you by taking care of the more difficult tooth problems.

Remove a tooth only when it is necessary. Here are three reasons to take out a tooth:

- **It hurts** all the time (or if the pain starts by itself, often waking the person at night)
- **It is loose** and **hurts when you move it.**
- **It has a broken root** (p. 90) or a **broken top with an exposed nerve.**

It is important to learn from another person, not just from a book. Find an experienced dental worker who can show you how to take out a tooth and who can then watch you as you try it yourself.

Before You Begin: Ask Questions!

Before you take out a tooth, you need to learn about the person’s health. Tell the person what to expect, and then ask:

- Do you bleed a lot when your skin is cut? (If so, you may bleed a lot when your tooth comes out.)
- Do you have swollen feet and difficulty breathing? (You may have heart disease.)
- Do you have any allergies? (You may be allergic to some medicines we give when we take out a tooth.)
- Are you a diabetic? (If you have diabetes, your wound will take a long time to heal.)

If the person answers “yes” to any of these questions, you must take special precautions. See the next page.
FOUR PROBLEMS TO WATCH FOR

A person who bleeds a lot must know how to prevent bleeding afterward. Explain very carefully the steps given on page 155. You may also want to place a suture (p. 155) to hold the gums tightly together.

Persons with heart disease often take medicine called anticoagulants that do not allow the blood to clot normally. Ask what medicine the person takes. Heparin is an example of an anticoagulant. Another heart medicine, digitalis, is not an anticoagulant. If the medicine is not an anticoagulant, you can take out the tooth. But do not use more than 2 cartridges (3.6cc) of local anesthetic. The epinephrine inside the anesthetic can harm a weak heart. (See p. 131, #2).

A person with allergies may be allergic to aspirin, penicillin, erythromycin, or other medicines you often use. Find out which medicine has caused problems and give a different medicine, one that will not cause a reaction.

A diabetic's wound may become infected. Watch carefully the place where you took out the tooth and give antibiotics (page 88) if an infection begins.

BE PATIENT, CAREFUL, AND CONSIDERATE

- Inject local anesthetic slowly in the right place, so the tooth becomes numb and you do not hurt the person when you remove it. If the person says the tooth still hurts, it is probably true! Inject again.
- Use the correct instrument in the correct way. If you are careful you can avoid breaking the tooth. When you take out a baby tooth, be extra careful not to hurt the new tooth growing under it.
- Explain everything to the person. Tell the person if something is going to hurt, even a little. When you take out the tooth, you can explain, for example, that there will be a feeling of pressure. Press on the person's arm to demonstrate what it will be like. When you finish taking out the tooth, explain what you have done and what the person can do at home to help the mouth heal.

THE INSTRUMENTS YOU NEED

Buying instruments can be confusing, because there are so many. Only a few of them are really necessary. You can take out most teeth with the 4 basic instruments on the top of page 149.

When you order, use the proper name. Many companies use numbers to describe the instruments, but a different company may use a different number. If you use the proper name along with the number given here, most companies will understand what you want.*

*All of the instruments in this chapter are available at low cost from: ECHO, 4 West Street, Ewell Surrey KT17, 1UL, England. (See p. 173.)
The Four Basic Instruments

You can take out most teeth with these 4 instruments:

<table>
<thead>
<tr>
<th>A spoon or probe . . .</th>
<th>. . . an elevator . . .</th>
<th>. . . and two forceps</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Spoon or Probe" /></td>
<td><img src="image2.png" alt="Elevator" /></td>
<td><img src="image3.png" alt="Upper Universal Forcep" /></td>
</tr>
<tr>
<td>Use this to separate the gum from the tooth.</td>
<td>An elevator will loosen a tooth, or lift out a broken root.</td>
<td>150 upper universal forcep</td>
</tr>
<tr>
<td><img src="image4.png" alt="Upper Bicuspid Forcep" /></td>
<td><img src="image5.png" alt="Cowhorn Forcep" /></td>
<td>75 lower bicuspid forcep</td>
</tr>
<tr>
<td><img src="image6.png" alt="Lower Molar 'Hawk's Bill' Forcep" /></td>
<td>Use forceps to pull out the tooth. There is one for upper teeth and one for lower teeth.</td>
<td></td>
</tr>
</tbody>
</table>

Other forceps can be useful, especially for taking out a strong back tooth. They have pointed beaks that are made to fit between the roots of a back molar. As a result, you can hold onto the larger tooth better.
Curved elevators are good for taking out broken roots. You can force their pointed ends more easily between the root and the bone that is holding it.

![Curved Elevators](image)

Unfortunately, forceps and elevators are expensive. If you want to order more than the 4 basic instruments (p. 149), remember the cost.

WHERE YOU WORK IS IMPORTANT

Work wherever it is light and bright. You must be able to see what needs to be done. Sunlight or light from a lamp is usually enough. Use a dental mirror (p. 139) to direct more light into the mouth.

Use a chair that has a back high enough to support the person's head.

Think about how you can stand and work the most easily:

- **To take out a lower tooth**, you need to push down and then pull up. So the person should be sitting down low.
  - If you stand on a box, he will be lower.

- **To take out an upper tooth**, you need to push up and then pull down. So the person should be sitting up high.
  - If he sits on cushions, he will be higher.
HOW TO TAKE OUT THE TOOTH

Once you are certain which tooth must come out, decide which instruments you will need. Lay them out ahead of time on a clean cloth:

Before you touch your instruments, be sure your hands are clean. Wash with soap and water. Be sure, also, that your instruments are clean. See pages 82 to 85. Prevent infection—keep clean!

To take out a tooth, follow these 8 steps (pages 151-158):

1. Explain what you are going to do.
2. Inject local anesthetic.
3. Separate the gum from the tooth.
4. Loosen the tooth.
5. Take out the tooth.
6. Stop the bleeding.
7. Explain to the person what to do at home to look after the wound.
8. Help the person to replace the tooth with a false tooth.

1. Always begin by talking to the person. Explain why you must take out a tooth (or teeth) and tell how many teeth you will take out. Begin working only when the person understands and agrees.

2. Inject some local anesthetic slowly, in the right place. Remember from Chapter 9 that the injection for a lower tooth is different from the injection for an upper tooth.

Wait 5 minutes for the anesthetic to work, and then test to be sure the tooth is numb. Be kind—always test before you start. If the person still feels pain, give another injection.
3. **Separate the gum from the tooth.** The gum is attached to the tooth inside the gum pocket. Separate the gum and tooth before you take out the tooth. If you do not, the gum may tear when the tooth comes out. Torn gums bleed more and take longer to heal.

Use this \[\text{Diagram of instrument}\] or this \[\text{Diagram of instrument}\]

Slide the end of the instrument along the side of the tooth into the gum pocket. At the deepest part of the pocket, you can feel the place where the gum attaches to the tooth.

Push the instrument between this attached part and the tooth. Then separate the tooth from the gum by moving the instrument back and forth.

Do this on both the cheek side (outside) and the tongue side (inside) of the tooth.

The attached gum is strong, but it is also thin. Control your instrument carefully so that it only cuts through the part that is attached to the tooth. Do not go any deeper.

4. **Loosen the tooth.** A loose tooth is less likely to break when you take it out. Before you take out a strong tooth, always loosen it first with a straight elevator.

Caution: if you do not use it properly, a straight elevator can cause more harm than good.

It is important to hold a straight elevator properly. Place your first finger against the next tooth while you turn the handle. This will control it. Remember that the sharp blade can slip and hurt the gums or tongue.

The blade goes between the bad tooth and the good one in front of it. Put the curved face of the blade against the tooth you are removing. Slide the blade down the side of the tooth, as far as possible under the gum.

Turn the handle so that the blade moves the top of the bad tooth backward. Put pressure on the bone, not the tooth beside it. Do not loosen the good tooth!
5. Now, take out the tooth. Push your forceps as far up the tooth as possible. The beaks of the forceps must hold onto the root under the gum.

Use your other hand to support the bone around the tooth. Your fingers will feel the bone expanding a little at a time as the tooth comes free. With practice, you will be able to decide how much movement the tooth can take without breaking.

To decide which way to move a tooth, think about how many roots it has.

If a tooth has 1 root, you can turn it.

If a tooth has 2 or 3 roots, you need to tip it back and forth.

Take your time. If you hurry and squeeze your forceps too tightly, you can break a tooth.

Removing a tooth is like pulling a post out of the ground. When you move it back and forth a little more each time, it soon becomes loose enough to come out.
Front teeth come straight out:

Back teeth usually come out toward the cheek:

When you remove lower molars with the lower molar 'cow-horn' forcep, you use it in a different way:

Fit the points under the gum, between the tooth's roots.

Squeeze the handles gently and move them up and down, then side to side. This will force the points of the forcep further between the roots and lifts the tooth up and out.

Note: some lower molars come out toward the tongue.

**Warning:** Do not use the 'cowhorn' forcep to take out a baby molar. Its points can damage the permanent tooth growing under it.

When the tooth comes out, look carefully at its roots to see if you have broken any part off and left it behind. **Whenever possible, take out broken roots so that they do not cause infection later inside the bone.**
6. Stop the bleeding. Squeeze the sides of the socket (the hole that is left after you take out the tooth) back into place. Then cover the socket with cotton gauze and ask the person to bite firmly against it for 30 minutes. A child should bite firmly on the gauze for 2 hours. See p. 136.

Whenever the gums are loose, join them together. To stop the bleeding and heal the wound, you must hold the gums tightly against the bone under them.

**HOW TO PLACE A SUTURE**

When you remove two or more teeth in a row, it is a good idea to join the gums with a suture (needle and thread). If you need more than one suture, place the first one nearest the front of the mouth and work toward the back.

The needle and thread you use must be sterile. Boil both for twenty minutes. See page 84.

You will need an instrument to hold the needle firmly (hemostat) and scissors to cut the thread.

A. Pass the needle through the loose gum—the one you can move most easily. Then pass it through the more firmly attached gum.

If the looser gum is on the outside, you will bring the needle toward the tongue. Protect the tongue with a tongue blade or your dental mirror.

You must suture both the upper and the lower gums in this way.

After this you must tie two knots and cut the thread. See the next page.
B. Pull the thread until about 4 cm. of thread is left loose on the starting side.

Wrap the longer end of thread 2 times around the beaks of the needle holder.

Then grab the shorter free end of the thread with the tip of the needle holder. With the needle in your fingers, pull the needle holder in the opposite direction. The thread will slide off the beaks and form the first knot.

Tighten the knot onto the side of the wound, not on top of it.

C. Tie a second knot, to keep the first one tight.

Wrap the thread once around the beaks of the needle holder.

Grab the free end with the tip of the needle holder as you did before. Pull the two ends in opposite directions. The second knot will form over the first knot.

D. Cut the threads so that about 1/2 cm. is left free. If the ends are too long, they will bother the person's tongue. If they are too short, the knot may come open.

Then cover the area with cotton gauze. Tell the person to:

- bite against the cotton for 1 hour to stop the bleeding
- return in 1 week for you to remove the thread

There is a special kind of suture material that disappears by itself, which is good to use because the person does not have to return for you to remove sutures. Unfortunately, it is expensive. If you cannot afford it, use sewing thread and remove it 1 week later.
7. Explain to the person what you have done, and what to do at home to look after the wound. Remember that her mouth is numb, so she cannot feel what is happening.

Taking out a tooth is like a small operation. There will be bleeding and later some pain and swelling. This is normal and should be expected. Tell the person this. Then give the following advice:

- **Bite firmly on cotton gauze** for an hour, and again later if blood comes from the socket.

  Always give the person some extra cotton gauze to carry home, in case bleeding starts again later. Show her how to use the cotton gauze.

- **Take an aspirin for pain** as soon as you need it, and then one every 3 or 4 hours. See page 88.

- **Keep your head up when you rest.** This reduces bleeding because it is harder for blood to flow uphill. It also hurts less.

- **Do not rinse your mouth.** In some places people believe they should immediately rinse with salt water and spit a lot after a tooth comes out, but this is harmful! It is important for the blood clot to stay inside the socket and not wash away.

- **Do not drink hot liquids** like tea or coffee, because they encourage bleeding. However, cool liquids are good for you. Drink a lot of water.

- **Continue to eat,** but be sure the food is soft and easy to chew. Try to chew food on the side opposite the wound.

- **Keep your mouth clean.** Start on the second day and continue until the socket is well. To do this, rinse your mouth with warm salt water (p. 7) and keep your teeth clean (pages 67-70), especially the teeth near the socket.

**False Teeth**

After a tooth comes out, it is a good idea to replace it with a false tooth. If you do not, the other teeth soon start to shift into the open space.

This weakens the bone around their roots. After some years, they too become loose and sore, and they have to be taken out.
WHY FALSE TEETH ARE HELPFUL

When you take out a tooth, it is like removing a brick from the center of a wall. The area around the space becomes weaker and begins to crumble.

To prevent this, a plastic tooth can fit into the space. This tooth is not for chewing food but to hold the remaining teeth in their normal, healthy position.

A full set of teeth allows a person to chew the foods needed to stay healthy and feel good. Moreover, teeth help you look good!

A person without many teeth looks old.

With a new set of plastic 'false teeth', the same person looks and feels much younger.

This book does not show how to make false teeth. In a later book, we hope to give instructions for false teeth, dentures, and permanent fillings (see page 145). If possible, after you take out a tooth, encourage the person to replace the tooth with a plastic tooth. Find out where they are made and how much they cost. Then explain:

- how to clean the remaining teeth to prevent them from going bad (pages 67-70), and
- how it is possible to get a replacement plastic tooth.
PROBLEMS THAT CAN OCCUR

Sometimes a problem develops even though you have tried to be careful. Give help whenever you can. If you are not able to help, refer the person to a doctor or dentist as soon as possible.

Broken Roots

If you can see the root, try to remove it. If you leave a broken root inside the bone, it can start an infection.

Removing a broken UPPER root. Use your straight elevator. Slide the blade along the wall of the socket until it meets the broken root.

<table>
<thead>
<tr>
<th>1. Force the blade between the root and the socket.</th>
<th>2. Move the root away from the socket wall.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Diagram" /></td>
<td><img src="image2.png" alt="Diagram" /></td>
</tr>
<tr>
<td>3. Move the root further until it is loose.</td>
<td>4. Grab the loose root and pull it out.</td>
</tr>
<tr>
<td><img src="image3.png" alt="Diagram" /></td>
<td><img src="image4.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

Removing a broken LOWER root. Use a straight elevator (or a curved elevator if you have one). If the broken root is from a molar tooth, slide the blade into the socket beside the broken root.

<table>
<thead>
<tr>
<th>1. Break away the bone between the root and the blade.</th>
<th>2. Force the blade between the root and the socket.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image5.png" alt="Diagram" /></td>
<td><img src="image6.png" alt="Diagram" /></td>
</tr>
<tr>
<td>3. Move the root away from the socket wall.</td>
<td>4. Grab the loose root and pull it out.</td>
</tr>
<tr>
<td><img src="image7.png" alt="Diagram" /></td>
<td><img src="image8.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

Warning: It is better to leave a small broken root inside the socket. In a week or so, it will loosen itself and be easier to remove.
Root Pushed Into the Sinus

An upper root that seems to disappear may have gone into the sinus (p. 89). **Do not try to find it.** Instead, cover the socket with cotton gauze and send the person to the hospital. A special operation is needed to open the sinus, find the root, and take it out.

Ask the person not to blow his nose. That forces air through the opening and prevents it from healing.

Bone Chips and Tags of Flesh

Small pieces of bone that lie loose inside the socket can cause bleeding and delay healing.

Gently reach into the socket with the end of an elevator or spoon instrument. Feel for the piece of bone and carefully lift it out.

**Give local anesthetic if needed.**

When you are finished, ask the person to bite on cotton gauze until the bleeding stops.

Small tags of flesh are not serious, but they bother the person. Hold the tag steady with cotton tweezers and use sterile scissors carefully to cut the bit of flesh free.

Rinsing with warm water makes gums tough and helps them heal. But do not rinse for the first 24 hours. See page 157.

Bleeding

If the first cotton gauze (p. 155) does not stop the bleeding in the socket, place more cotton gauze. Wait 5 minutes to see if the bleeding stops. If this does not work, follow the steps on pages 155-156 for placing a suture.

Swelling

Hold a cloth wet with **cold** water against the face. This helps to **prevent** swelling. This is a good thing to do if the tooth was hard to take out, or if it took a long time.

If there already is swelling, **heat** against the face will help to **reduce** swelling. Hold a cloth wet with hot water against the swollen area, 30 minutes on and 30 minutes off. **Be careful not to burn the skin!**

A large swelling usually means there is an infection. The person needs additional treatment. See page 110.
Painful Socket

The socket area often hurts for a day or so after the tooth has been removed. Aspirin (p. 88) is usually enough to relieve the pain.

A strong, steady pain that lasts for several days is a sign that the person is having a problem called dry socket. The treatment for this special kind of problem is given on page 111.

Dislocated Jaw

When you press against a person’s jaw while taking out a tooth you can sometimes dislocate it. The jaw has been pushed out of position and it is not able to go back again.

We describe the care for a dislocated jaw on page 107.

**Most important:** Be sure to tell each person you treat:

"If your problem gets worse, you can come back to see me immediately!"

CLEAN YOUR INSTRUMENTS AFTER YOU FINISH

If your instruments are dirty, they can pass on germs that cause tetanus (page 112) or hepatitis (see page 172 in *Where There Is No Doctor*).

Germs on dirty instruments can also go into the socket and start an infection.

Dental instruments must be not only clean, but also sterile. This means they need to be both scrubbed and then boiled before they can be used again. See pages 82 to 85.

Use a brush and clean each instrument with soap and water.

Be careful to scrub away all bits of old dried blood.

Then kill the germs by placing the instruments into a covered pot of boiling water for 20 minutes.
Keep your sterile instruments together in a clean place.

Wrap them in a clean cloth  **OR**  Leave them in disinfectant (See p. 85)

Mark with tape the names of the instruments inside.  Before you use any instrument again, wash it with clean water—to remove the taste of the disinfectant.

Germs living in dirty cotton can easily go inside the socket and start an infection. It is important, therefore, to keep the cut pieces in a container that is clean and has a cover. Use clean tweezers to remove the cotton gauze when you need some.

Also, keep your room and work area clean. Sweep the floor every day, and wipe down the chair and tables as often as possible.

**Staying clean is a part of staying healthy.**
After you have read Chapters 1-11, you will want to use pages 163-195 for reference—to return to later and read when you want to find information quickly.

Pages 163-173: The Dental Kit
  Medicines ........................................ 164-165
  Instruments ...................................... 166-171
  Supplies ......................................... 172-173

Pages 174-176: Records, Reports, and Surveys

Pages 177-179: Story Telling: An example about pregnancy
  Story about pregnancy and dental care .... 177-178
  Dental care for pregnant women ............ 179

Pages 180-181: Dental Health Teaching Materials

Pages 182-186: Vocabulary

Pages 187-192: Index
THE DENTAL KIT

In the next 10 pages, there are lists of medicines, instruments, and other supplies recommended in this book. Keep them together in a kit. **You may want to change some of them, or add others to meet your own needs.**

As a dental worker, you will be able to get many of the items on the lists from your government medical stores. Some things you will have to buy yourself. That can be expensive, so we make several suggestions to help you save money.

Before you order, decide how many of each thing you need. Ask yourself: How many persons do I treat each day? For what problems? Then order enough medicines and supplies for three months. **Note:** as more people learn about the treatment you can give, more will come to ask for your help. Remember this when you order. Remember, also, that some persons may need more than one treatment.

On pages 164 to 169 we give an example. We recommend how many medicines, supplies, and instruments you will need if you see 10 people a day—200 a month. You cannot be exact, of course, because you cannot predict exactly what problems will arise. However, we can say that, **on the average:**

In a group of 10 persons with urgent problems:
- 6 persons need you to take out 1 or more teeth (so you must inject)
- 2 persons need cement fillings
- 2 persons need medicine before you can treat them.

Many of these persons must return for another visit:
- 5 persons need you to scale their teeth and teach them how to care for them better
- 1 person will need a cement filling
- 2 persons will need treatment after taking medicine.
Another antibiotic, tetracycline, is not recommended for any of the treatments in this book because it is a broad-spectrum antibiotic. Narrow-spectrum antibiotics (see 'antibiotics', p. 182) are usually safer and just as effective for most dental problems. If you do use tetracycline, read page 353 of Where There Is No Doctor and remember, do not give tetracycline to a pregnant woman or to a young child. Tetracycline can make a young, developing tooth turn yellow.

**SUGGESTIONS:**

1. Compare prices before you buy medicines. Often the same medicine has many different names. The **generic name** (the name we use on this page) usually is cheapest, and the medicine is just as good as the 'brand-name medicines'. Use the generic name to order and buy, not the brand name.

2. Always look for a date on the package. It is called the expiration date (or expiry date). **If today is later than that date, do not buy or use that medicine.**

3. Be careful to give the correct dose. Read the next two pages carefully, as well as the 'Treatment' section of each problem in Chapter 7. If pages 165 and 166 are not clear to you, read Chapter 8 (pages 59 to 64) of Where There Is No Doctor.

4. For serious infections or serious pain, see page 166.

</tbody>
</table>
THE CORRECT DOSE

Before you give medicine, think about the sick person’s weight and age. The smaller children are, the less medicine they need. For example, pain medicine like aspirin (300 mg tablets) or acetaminophen (500 mg tablets) can be broken up into smaller tablets:

Four times a day:

Adults take 2 tablets
Children 8-12 take 1 tablet
Children 3-7 take 1/2 tablet
Babies take acetaminophen only, 1/4 tablet

Notes: Do not hold aspirin on the bad tooth. Aspirin has acid that can hurt the tooth. Always swallow aspirin immediately. For severe pain, when aspirin does not help, an adult can take a 30 mg tablet of codeine.

Antibiotics: To Fight Infection

Antibiotics kill bacteria that cause infections. Some antibiotics work better than others on certain bacteria. If you can, test the pus (p. 186) to find which antibiotic works best.

Do not give penicillin to a person who is allergic to it. Ask about the person’s allergies before you give penicillin pills or injections. When you inject penicillin, always keep epinephrine (Adrenalin) ready to inject if the person shows signs of allergic shock. Stay with the person for 30 minutes. If you see these signs . . .

- cool, moist, pale, gray skin (cold sweat)
- weak, rapid pulse (heartbeat)
- difficulty breathing
- loss of consciousness

. . . immediately inject epinephrine: 1/2 ml for adults or 1/4 ml for children. For more information on allergic shock, see Where There Is No Doctor, pages 68 to 72.

Always give the full dose of penicillin or any antibiotic, even if the person feels better. See page 88 for the correct dose of penicillin or erythromycin in 250 mg tablets. Erythromycin also comes in liquid form. It has 125 mg in 5 ml, so 10 ml of liquid (about two large teaspoons) is the same as one tablet.

It is important to take a strong first dose of penicillin or erythromycin, and then smaller doses four times a day for 3 to 5 days after that. Carefully read the instructions on page 88.
INJECTIONS: FOR SEVERE INFECTIONS

It is always safer to take medicine by mouth. Sometimes, however, an infection is so bad that you need to give medicine by injection. Learn how to give injections from an experienced health worker. The injections described on this page are not like the anesthetic injections in Chapter 9 of this book—you must inject these medicines into a large muscle in the buttocks or arm. For more instructions on this kind of injection, see Chapter 9 (pages 65-74) of Where There Is No Doctor.

For severe infection: There are two kinds of penicillin to inject.

For very severe infections, give 'crystalline penicillin' every 6 hours for the first day. It acts quickly and for a short time only.

### FLUORIDE WATER

You can use a solution of fluoride and water (above, number 5) in two ways:

**To treat a sensitive tooth**, make this concentrated mixture (see box above). Mix:
- 500 tablets sodium fluoride (1.1 mg each) in 59 ml of water
- 1 gram of sodium fluoride powder with 50 ml of water.

Put cotton rolls between the lip and gum on each side of the bad tooth. Dry the bad tooth with cotton and look for the small groove that is causing the pain. Wet some cotton with the fluoride water and rub it on the tooth. Keep the tooth wet with fluoride water for 1 minute. One week later, give the same treatment again.

**To help prevent cavities**, especially in children, make a solution of fluoride and water using sodium fluoride powder. Mix 2 grams of the powder with 1 liter of water. Then, **once a week**, take a mouthful and rinse for 60 seconds with teeth closed together, 'washing' every surface of every tooth. Then spit it out—do not swallow the fluoride water. Also, do not eat or drink for 30 minutes.

**School is a good place to do a weekly fluoride rinse.** Students can brush each day at school (page 57), and then on the same day each week, they can each take a mouthful from the liter bottle of fluoride water. On page 22 of this book, children are shown using a twice-yearly application of a special paste, a 'topical fluoride gel'. This is good, but the weekly rinse is even better, for the teeth.
Weight (how heavy something is)

1 kilogram (kg) = 10 x 100 grams (g)

1 kilogram = 1000 grams
1 gram = 1000 mg
1 grain = 65 mg

Volume (how full something is)

1 liter = 1000 ml
1 cup = 236.5 ml
1 teaspoon = 5 ml
1 ml = 1 cubic centimeter (cc)

wooden tongue depressors

SUGGESTIONS:

If you order your supplies in bulk long before you need them, you probably will pay lower prices. If you have a place to store supplies that is clean, dry, and free from cockroaches and rats, consider ordering enough for one year instead of only 3 months.
INSTRUMENTS

When you are treating several people on the same day, you will need to clean some instruments (see pages 82 to 85) at the same time that you are using others. Therefore, it is necessary to have several of each kind of instrument, to be sure that the instrument you need will be ready (clean or sterile) when you need it.

There are three instruments you will need for each person who comes to you, no matter which treatment is needed. They are: a mirror, probe, and cotton pliers. Keep them together. Below we recommend that you have 15 of each of these, so you can keep one in each treatment kit. **You do not need to buy all of these instruments.** You can make several of them—see pages 170-172. If you like, buy only one example of each of the instruments below, and use them as models to copy when you make your own extra instruments.*

*Note: See pages 149-150 for recommendations of other elevators and forceps that are good to have if you can afford them.

*If you want the help of a charitable organization in buying instruments, see page 173.
MAKING YOUR OWN DENTAL INSTRUMENTS*

Here are a few ideas for making instruments at low cost. Try to use materials that are available where you live.

Can you think of any other materials you can use?

Each instrument has two parts: a handle and a working piece at the end. Join them together:

... with wire:

... with glue or even wax:

If you make the end flat, it can prevent the working piece from turning. Pound the working piece with a hammer and make a flat slot in the handle so the working piece cannot turn.

*I am grateful to Aaron Yaschine for the ideas in this section.
Making the Three Instruments You Use Most

**Mirror:** Use old pieces of mirror or a shiny piece of tin. You even can use a polished silver coin. A tongue depressor is the handle.

**Probe:** Use the end of a paper clip, pin or needle for the working piece. Rub it against a smooth stone to sharpen it. Bend it so it can reach around to the back of a tooth. Attach the working piece to a smooth stick handle (p. 170).

**Tweezers:** Draw the shape on a piece of tin and then cut it out with strong scissors. Use a file or a smooth stone to make the edges smooth. Bend in half to make the tweezers.
Making Other Instruments and Supplies

Spoon: Bend a paper clip or needle. Flatten the end. Then pound a small stone against the end, to make it hollow. Make 2 bends and attach to a stick handle.

Filling Tool: Remove the heads from 2 long screws. With a file and hammer, make the end of one screw flat and the end of the other screw round. Bend each end in the direction of the edge (not the face) of the flat side. Attach both working pieces to a small stick handle.

Dental Floss: When using string to clean between your teeth (pages 69-70), you may have trouble getting this string down in between your teeth. Sometimes, also, the string gets caught there, forming a kind of ‘bird’s nest’. Three things can cause problems with dental floss:

1. An incorrectly made filling—flat and rough instead of round and smooth. Replace it.

2. Teeth too tight together. Use the floss on a tooth. Then pull the string out from between the teeth as you press the free end down against the gum with the fingers of your other hand. If there is a sharp filling on a tooth, the string will stay under it as it comes free.

3. String that is too thick. Make thinner but stronger floss by waxing as in this picture. The wax also will make the floss easier to slide between your teeth.

(1) Soak thin string in hot wax. (2) To remove the extra wax, pull the string between your fingers.
Buying Dental Instruments

When you do not have much money, you must spend wisely. Dental instruments are very expensive, especially when you buy them at commercial prices. You may want help to find the lowest prices available to you.

The Dental Health Services Unit of AHRTAG (AHRTAG means Appropriate Health Resources and Technologies Action Group Ltd.) may be able to help. Write to them and tell them what you are doing and what you need. AHRTAG can use the information to develop the right kind of projects in other countries. In return, AHRTAG possibly can give you good advice to help you buy or make your own low-cost dental equipment. Their address is:

AHRTAG
85 Marylebone High Street
London W1M 3DE
England.

There are many organizations that collect health supplies, including dental instruments. Some prefer to help church-sponsored health projects, but others will provide instruments at reduced cost to whoever needs them. One of the best of these organizations is ECHO. They can provide any of the instruments mentioned in this book. They also sell at lower than commercial prices. For example, for the four instruments at the bottom of page 169 for removing teeth (excavator, elevator, upper forcep, and lower forcep), ECHO’s 1983 price is £17.98, or about 28 U.S. dollars. Write to them with a list of the instruments you need:

ECHO
4 West Street
Ewell Surrey KT17 1UL
England.

Other organizations who may be able to help are:

RECORDS, REPORTS, AND SURVEYS

For record keeping, you can divide the mouth into 4 parts:
- Upper Right (UR)
- Upper Left (UL)
- Lower Left (LL)
- Lower Right (LR)

In each part there are 8 teeth (fewer in children—see p. 41).

Here are the short names of 4 teeth. Can you find the tooth named LL5?

Keep a record of each person you see. Write some brief information about the person and the problem. This way, if the person returns, you remember what you did to help.

When a person needs to come more than once to take care of a problem, it is better to keep a special record for that person. With all the treatments on one page, you can follow that person’s progress more easily. Below is an example for a person named Yupere. Yupere has a bad tooth that has hurt from time to time for 2 months. One day when he woke up, his face was swollen. Yupere decided to wait a day to see if the swelling would go away. The next day it was worse, so he went to the medical post for treatment.

Reports

You need to write a report whenever you send a person for medical help. Give as much information as possible so that your treatment can continue and new treatment starts as quickly as possible. If you cannot go along, always send a report with a sick person.

The story of Naime: After drinking for several hours, Naime’s husband returned home asking for money. She had none and told him so. He did not believe Naime, so he beat her with his hands and then a knife. Naime’s friends carried her, unconscious and bleeding, to the aid post. The front part of her lower jaw was hanging out of position.

**Yali Aid Post**

December 31, 1981

Time: 11:30 P.M.

---

**Patient:** Naime Pato, 25 years

**Diagnosis:** Cuts and a broken jaw

This lady was beaten by her husband tonight.

I saw her at 10:30 AM and treated her by:

1. Suturing the cuts on her face.
2. Giving tetanus toxoid 0.5 ml.
3. Giving Penicillin 1,200,000 units
4. Giving aspirin 2 tablets
5. Making a head bandage to support her jaw.

Please treat her broken jaw. Later I can help her at home with a special diet.

Sincerely,

Nisa Stephen

Aid Post Orderly
Surveys

It is a good idea to know how many persons in your community have cavities and gum disease. Look in the mouths of children and adults and make a record of what you see. Here is an example that is used in Mozambique:

Put a line through the circle for each person with:

- cavities
- red, swollen gums

The dental workers in Mozambique do a quick survey in 2 schools, 2 mother-and-child health clinics, and 2 cooperatives or factories in their community.

In each place, they examine 50 persons. This is enough to give an idea of the general health of teeth and gums in the community.

They make a paper for each age group. Each paper has 3 sections. They make a mark for each person they see, until all 50 circles have marks in them. They make extra marks if they see a tooth and/or gum problem.

In this example, you can see that children have more problems with cavities, while adults suffer more from gum disease. This is often true.

This survey helps the dental worker in three ways:

1. It shows how serious tooth decay and gum disease are in the community.
2. It shows which age group is suffering the most. To these people the dental worker must plan to give the most attention.
3. It gives the dental worker something to show the people when they are discussing why to change some old habits and adapt some new ideas.
Story Telling

Pregnancy and Dental care—an example

People everywhere have a tradition of teaching with stories. Many of the things we believe, we learned through stories we heard from parents, friends, and teachers. This is good, except when a story teaches something that isn’t true! When a woman gets pregnant, for example, she hears many stories, and she wants to learn whatever she can from these stories. Unfortunately, some traditional beliefs about pregnancy are partly wrong. An example is the belief that one must always have dental problems during pregnancy.

Here is a story you can tell to help people see that they are partly right about pregnancy and dental problems, but that there is more to understand.

A Story: Bertine’s teeth

Bertine was the dental worker in her village. She was a young woman, but the villagers respected her because she was such a careful worker, and because she knew how to fill cavities and pull teeth without hurting people. She also spent a lot of time teaching people how to avoid dental problems. “Clean your teeth every day!” she often said, at her clinic, at the schools, at village meetings. “Eat a mixture of foods, especially a lot of fruits and vegetables! Avoid candy and sweet, sticky foods!”

When Bertine was 23 years old, she got married and became pregnant. She also began to have some tooth problems of her own. She saw that her gums were bleeding when she cleaned her teeth, and she had small cavities in two of her teeth. As the dental worker, she was embarrassed to have tooth problems, but an older woman told her, “It’s natural to lose teeth when you have babies, Bertine. As we say, ‘For each child, a tooth’.”

One day Lucie, a dental worker from a nearby village, came to see her friend Bertine. Lucie had a young baby, and Bertine asked her a lot of questions about babies and about pregnancy. Then Bertine said, “Of course, I’m having lots of problems with my teeth.” “Why do you say ‘of course’?” asked Lucie. “Well,” Bertine replied, “For each child, a tooth.”

“But that’s not true!” Lucie cried. “You think you are having tooth and gum problems because you are pregnant, but I bet you are having these problems for all the usual reasons.”
"The usual reasons?" asked Bertine.

"Yes," said Lucie. "How often do you eat now that you are pregnant?"

"Well, a lot more than I used to—I have two persons to feed!" "And do you still eat sweet foods sometimes?" Lucie asked. "I guess I do," said Bertine, "and more sweets than before, because I eat more often."

"How about teeth cleaning?" asked Lucie. "Do you clean as often as you did before you were pregnant?" "No," Bertine admitted, "I heard I was going to have tooth problems anyway, and I have been so tired lately . . . . Oh! Do you suppose that these are the only reasons I am having these problems? How do you know so much about this, Lucie?"

"Because I had the same problems, Bertine. I learned the truth the hard way. I had an infected tooth, and the infection passed to my kidneys. At the health clinic, they told me it is not necessary to have tooth problems during pregnancy—and it is even dangerous. I am lucky I did not lose my baby! That can happen, you know, when a tooth problem is not treated. We must fill your cavities right now."

"You mean I can be treated now, before I have my baby?"

1. 
2. 
3. 
4. 

"Yes, and you should!" said Lucie. "And you can take better care of your teeth. It is true that because of the pregnancy, your gums are weaker, and they can get infected. But this means you should take even more care than usual to: (1) clean regularly and (2) eat the right foods. You need to have strength when you are pregnant. An infection in your mouth does not help that. Because your gums are weak, it is also good to (3) rinse your mouth every day with warm salt water*, and if you cannot get fresh fruits and vegetables, then (4) take a tablet of Vitamin C every day."

Lucie then offered to clean Bertine's teeth and to fill her cavities. When she touched Bertine's gums, they bled, and Lucie said, "They will bleed at first, but after you clean them regularly for a while, they will be stronger. Bleeding gums are dangerous to a pregnant woman. The bleeding can increase anemia, which is a serious problem."

"If a pregnant woman's tooth has an abscess, is it safe to pull it before she has the baby?" asked Bertine. "Yes," said Lucie, "you just must be gentle. A woman gets tired sitting in a dental chair for a long time, and sometimes you must give some extra anesthetic so she does not feel any pain."

*See page 7.
GIVING DENTAL TREATMENT TO A PREGNANT WOMAN

As we see from the story of Bertine and Lucie, it is possible—and good— to treat a pregnant woman’s dental problems before she has her baby.

In two situations, it is sometimes better to wait for the baby:

(1) Sometimes the woman’s gums become swollen and the swelling does not go down even after cleaning with a soft brush and rinsing with salt water.

These swellings must be cut away. She should have this small operation after the baby is born.

(2) During the last month of pregnancy, a woman may be too uncomfortable to have her tooth taken out. Control the infection with a 5-day course of penicillin (p. 88), and take out the tooth after the baby is born. It is also better to wait if the woman has high blood pressure, because she may bleed too much when you take out the tooth.

Caring for a pregnant woman—a guide for dental workers

1. Ask her how many months she has been pregnant, and find out if she has high blood pressure. Any person with blood pressure over 150/100 may bleed excessively after an extraction. To get this information, encourage all women to use the Mother and Child clinics.

2. Do not take X-rays of teeth unless absolutely necessary. X-rays are dangerous to the unborn baby inside. Before an X-ray, always cover the mother’s midsection with an apron lined with lead.

3. Always give a careful and complete mouth examination. Tell her what treatment she needs and how to prevent tooth problems.

4. Be gentle. Show the woman that you care, that you want her to be comfortable, and that you can treat her without hurting her.
DENTAL HEALTH TEACHING MATERIALS

In many different countries, teachers and dental workers have made their own materials to help them teach better. Below is a list of some of the materials we know about. We would like to improve this list. Please write us and let us know what you are doing. We will pass along your good ideas to others.

To receive the materials in this list, write to the addresses on the right.

A. Manuals and Notes

2. Dental Therapist Program. This book outlines the content of an existing 2-year basic dental care program for Native people living in isolated areas of Canada. English only.

B. Slides

1. Two slide sets to accompany Common Oral Diseases. Script in English.

2. ‘How to Take Care of Your Teeth’, slides of the puppet show shown on pages 27-37 and 27-38 of Helping Health Workers Learn.

C. Flannel-boards

‘Happiness is Healthy Teeth’. Presentation on dental health of children—a series of pictures to show the importance of brushing and healthy food.

‘Taking Care of Your Teeth, and Those of Your Children’. Large drawings showing local foods and possible ways of cleaning the teeth. Portuguese script available.

D. Flipcharts

1. ‘Taking Care of a Small Child’s Teeth’ and ‘Improving Your Dental Health’ are two separate poster-size sets, using enlarged photographs. Script, in English and Melanesian Pidgin, can be attached to the back of each poster.

2. Nutrition/Dental Flipchart. Poster-size flipcharts using photographs. Script, in both English and Melanesian Pidgin, is printed on the back of each poster.

3. Flipchart on dental health, in the form of a manual (approx 35 cm x 20 cm), for use in small groups. Discusses food and hygiene for adults and children. Explanation in Portuguese on the back of each picture.

4. Dental flipcharts for mothers and children in rural areas. Text in both English and Bengali on back of each chart. A booklet with further explanations is also included.

VOCABULARY

This vocabulary is listed in the order of the alphabet:
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Most names of sicknesses are not in this vocabulary. Find the name of a sickness in the Index and read about it in the book.

There are many words in this vocabulary that are not in the rest of the book, but you may see them in other books or hear dentists use them.

A

Abnormal Different from what is usual, natural, or average. Not normal.
Abscess A sac of pus caused by an infection. For example, a boil.
Acid A strong liquid that is produced from certain foods left in the mouth. Acid causes both tooth decay and gum disease.
Acute Sudden and short-lived. An acute illness is one that starts suddenly and lasts a short time. The opposite of 'chronic'.
Adrenaline Also called epinephrine. A drug which stimulates the heart, used for severe allergic shock.
Adult teeth See Permanent teeth.
Allergy A bad reaction after breathing in, eating, touching, or being injected with something. The reaction may be itching, sneezing, or difficult breathing.
Analgesic Medicine to calm pain. Aspirin, acetaminophen (paracetamol), and codeine all are analgesics.
Amalgam A special metal used in permanent fillings.
Anemia A disease in which the blood gets thin. Signs include tiredness, pale skin, and lack of energy.
Anesthetic A drug that causes the mouth or other part of the body to feel numb.
Antibiotic Medicine that fights infections caused by bacteria. A broad-spectrum antibiotic such as tetracycline kills many kinds of bacteria, while a narrow-spectrum antibiotic like penicillin kills only a few kinds of bacteria.
Appropriate Something that is the easiest, safest, and most likely to work in a particular situation or condition.
Arkansas stone A special stone used to sharpen dental instruments.
Aspirate To breathe. An 'aspirating syringe' is one that can 'breathe', or allow liquid to go both in and out of the needle tip.

B

Baby teeth The first set of teeth. There are 20 baby teeth, which are also called milk teeth or primary teeth.
Bacteria Tiny germs that you can only see with a microscope and that cause many different infectious diseases.
Beeswax Wax made by honey bees.
Bicuspid The teeth between the canine teeth and the molars, premolars.
Bite (1) To cut with the teeth. (2) The way the upper and lower teeth fit together when they close.
Blood pressure The force, or pressure, of the blood flowing through the blood vessels (veins and arteries).
Blood vessels Tubes that carry blood through the body. Veins and arteries.
Boil (1) To heat water until it bubbles. (2) A swollen, inflamed lump with a pocket of pus under the skin. A kind of abscess.
Brand name Trade name, the name a company gives to its product. A brand-name medicine is sold under a special name and is often more expensive than the same generic medicine.
Bridge False teeth that are glued onto several nearby healthy teeth.
Buccal Of the cheek. The buccal face of a tooth is the side facing the cheek.
Bulk Large quantity or amount.

C

Calcium A nutritional element which makes teeth strong and hard.
Calculus Tartar.
Calories Units of heat found in food, giving energy for the body to use.
Canine teeth Also called cuspids, dog teeth, and eye teeth. These teeth have the longest roots of any tooth.
Cancer  A tumor or lump that grows and may keep growing until it causes death.

Carbohydrates  Starches and sugars—foods that give energy. In this book they are called GO foods.

Caries  Cavities; tooth decay.

Cavity  A hole in a tooth where bacteria have entered.

Cement filling  A temporary filling, which may protect a tooth for up to 6 months. Also see Filling.

Cementum  The outer covering of the tooth's root.

Chronic  Long-term or frequently recurring (compare with 'acute'). A chronic disease is one that lasts for a long time.

Colony  A new place where a group of people start a community. This book speaks of 'colonies' of germs—where germs group together in a new place.

Community  A group of people living in the same village or area who have similar living conditions, interests, and problems.

Comparative diagnosis  A way of looking at symptoms and deciding which of several similar illnesses is causing the symptoms.

Contact  Touch. Contagious diseases can be spread by a sick person who makes contact with (touches or is close to) another person.

Contagious disease  A sickness that can be spread easily from one person to another.

Contraindication  A situation or condition when a particular medicine should not be taken, or a certain treatment not given. For example, many medicines are contraindicated during pregnancy.

Crown  The top 1/3 of the tooth, the part that is protected with hard enamel.

Curette  A scaling instrument.

Cuspid  Canine teeth.

Cyst  An abnormal, sac-like growth in the body which is often filled with water.

Diabetes  Frequent runny or liquid stools.

Dentition  A whole set of teeth.

Dental floss  See Floss.

Dental worker  A health worker who works for healthy teeth and gums.

Dentist  A professional who has advanced formal education in care of teeth and gums.

Dentures  False teeth.

Diagnosis  A decision made by a health worker about what a person's illness is. Also see Comparative diagnosis.
Floss  Special string used to clean between the teeth.
Fluoride  A chemical which strengthens the teeth. Painted on the teeth or added to water for drinking or rinsing, fluoride enters and hardens the enamel. It is especially good for children's teeth.
Forceps  Instruments used to pull teeth.
Fracture  A broken bone.

G
Gauze  A material made of cotton, woven into an open mesh.
Generic name  The scientific name of a medicine. Usually different from the brand names given it by the different companies that make it.
Germs  Very small organisms that can grow in the body and cause some infectious diseases; bacteria.
Gram  A metric unit of weight. There are about 28 grams in an ounce. A paper clip weighs about 1 gram.
Groove  A long, narrow cut on the surface of back teeth. Grooves are 'protected areas' because food and germs can hide and remain in them longer.
Gum bubble  Also called a gum boil. A small abscess on the gums.
Gum disease  Illness that causes gums to become loose, red, and swollen, and to bleed when the teeth are cleaned.
Gum pocket  The space between the tooth and the flap of gums around it, forming a small pocket.
Gums  The skin around the teeth.

H
Health worker  A person who takes part in making the community a healthier place to live.
Hemorrhage  Bleeding.
Hemostat  A needle holder, used for putting in sutures.
Herb  A plant, especially one valued for its medicinal or healing qualities.
History (medical history)  What you can learn through asking questions about a person's sickness—how it began, when it gets better or worse, what seems to help, whether others in the village or family have it, etc.
Hydrogen peroxide  A liquid used to clean wounds and kill certain bacteria.
Hygiene  Actions or practices of personal cleanliness that lead to good health.

I
Hypertension  High blood pressure.

J
Immunizations (vaccinations)  Medicines that give protection against specific diseases. For example, there are immunizations against diphtheria, tetanus, polio, tuberculosis, and measles.
Infection  A sickness caused by bacteria or other germs. Infections may affect part of the body only (such as a sinus infection) or all of it (such as measles).
Infectious disease  A disease that is easily passed from one person to another; contagious disease.
Inflammation  An area that is red, hot, and painful, often because it is infected.
Inject  To give a medicine such as an immunization or anesthetic, using a syringe.
Injure, injury  Harm; hurt.
Instruments  Tools that a dental worker uses to examine, clean, fill, or pull teeth.

K
Joint  The place where two bones meet. When this book talks about the 'pain in the joint', it means the joint (called the 'temporomandibular joint') where the cheek and jaw bones meet.
Kilogram (kg)  One thousand grams. A 'kilo' weighs a little more than 2 pounds.

L
Labial  Of the lips. The labial side of a tooth is the face of the tooth nearest the lips.
Ligature wire  A thin, strong wire that bends easily, used to attach a loose tooth to a strong tooth.
Lingual  Of the tongue. The lingual side of a tooth is the face of the tooth nearest the tongue.

M
Malnutrition  Health problems caused by not eating enough of the foods that the body needs.
Mandible  The lower jaw bone.
Maxilla  The upper jaw bone.
Mesial  The side of the tooth that faces the front of the mouth; the opposite of 'distal'.
Milligram (mg)  One thousandth of a gram.
Molar  The back teeth, used for grinding. Molars are the largest teeth in the mouth, with 2 or even 3 roots each.
Nerves  Thin threads or strings that run from the brain to every part of the body and carry messages for feeling, pain or movement. There is a nerve, along with a blood vessel, in every root of every tooth.
Normal  Usual, natural, or average. Something that is normal has nothing wrong with it.
Numb  Without feeling; anesthetized. When teeth and the gums around them are numb, they cannot feel pain.
Nutrition  The mixture of foods the body needs to grow, be healthy, and fight off disease.
Occlusal  The biting surface, or top, of the tooth.
Oral  Of the mouth. An oral medicine is one taken by mouth.
Organisms  Living things (animals or plants).
Palate  The roof or top part of the mouth.
Permanent filling  A filling using a special metal material which lasts for years.
Permanent teeth  The 32 adult teeth which grow into the mouth to replace the baby teeth.
Petroleum jelly (petrolatum, Vaseline)  A grease-like jelly used in preparing skin ointments.
Pharmacy  A store that sells medicines and health care supplies.
Plaque  A film or coating of germs that can form on the teeth, mix with food and make acid. You cannot see plaque unless you stain it.
Plate  A set of false teeth.
Precaution  Care taken in advance to prevent harm or prepare for emergencies before they happen.
Pregnancy  The period (normally 9 months) when a woman carries a child inside her.
Premolars  The teeth between the molars and the canine teeth; bicuspids.
Prenatal  Before birth.
Prevention  Action taken to stop sickness before it starts.
Probe  An instrument for examining teeth for tartar or other problems.
Protective foods  Foods that are rich in vitamins and minerals. They help build healthy bodies and make people more able to resist or fight diseases. In this book they are called GLOW foods.
Proteins  Body-building foods necessary for proper growth and strength. In this book they are called GROW foods.
Pus  A yellow-white liquid found inside infections.
Records, reports  Written information about sick persons and the treatment they receive. Records are for the personal use of the health worker, reports are written by one health worker to another to describe an illness and ask for further treatment.
Resistance  The ability of something to defend itself against something that would normally harm or kill it. Many bacteria become resistant to the effects of certain antibiotics.
Rinse  To hold a liquid in the mouth, moving it around inside the mouth.
Risk  The possibility of injury, loss, or harm. Danger.
Root  The lower part of the tooth, under the gum, connected to the bone.
Root canal  The hollow part of every root of a tooth, which has a blood vessel and a nerve inside.
Root canal treatment  A special operation on a dead tooth to remove material from the root canal and replace it with filling material.
Root fibers  Tiny fibers which hold the root of the tooth to the jaw bone.
Rotten teeth  Teeth with a lot of cavities.
Saliva  Spit. Saliva helps us to swallow our food.
Sanitation  Public cleanliness. Community sanitation efforts include disease prevention, hygiene, and keeping public places free of waste.
**Scab**  The crust of dry blood that forms over a wound.

**Scale**  To scrape the tartar off the teeth. A **scaler** is an instrument for scaling.

**Scientific method**  A way of learning something. It begins with information, then an idea, and then the idea is tested against the information available.

**Side effects**  Problems caused by using a medicine.

**Signs**  The things or conditions to look for when you examine a sick person, to find out what sickness the person has. In this book the symptoms (the problems a person feels) are included with signs.

**Sinus**  A hollow place inside the bone.

**Socket**  The wound left after you take out a tooth.

**Soft drinks**  Fizzy, carbonated drinks like Coca-Cola.

**Spatula**  An instrument used for mixing cement for fillings.

**Starches**  Energy foods like maize, rice, wheat, cassava, potatoes, and squash.

**Sterile**  Completely clean and free from living micro-organisms. Things usually are not sterile until you boil them or steam them.

**Sterilize**  To make things sterile by boiling or steaming for 20 minutes.

**Stools**  See **Feces**.

**Sugars**  Sweet foods like honey, sugar, or fruit that give energy but often cause tooth and gum problems.

**Survey**  A collection of facts about a small group of persons or things in the community. If the small group is not unusual, the survey results will describe the whole community.

**Suture**  A stitch made with needle and thread to sew up an opening or wound.

**Swelling**  An area of the skin that is abnormally large, puffed up. A **swollen** area is one that has swelling.

**Symptoms**  The feelings or conditions that sick persons report about their sickness. In this book, symptoms are included with signs.

**Syringe**  An instrument with a small sharp needle, for giving injections.

**Teaspoon**  A measuring spoon that holds 5 ml. Three teaspoons equal one tablespoon.

**Teething**  The action of new teeth cutting through the gums. Also see **Eruption**.

**Temperature**  The degree of heat of something, such as the air or a person's body.

**Temporary filling**  A filling meant only to last until a permanent filling can be placed.

**T.M.J.**  The temporomandibular joint. See **Joint**.

**Tooth abscess**  See **Abscess**.

**Tooth decay**  Damage to the tooth caused by acid; cavities.

**Toothache**  Pain in a tooth.

**Toothpaste**  A paste for cleaning teeth.

**Tongue depressor**  A tongue blade; a piece of wood used to keep the tongue out of the way when examining or treating the teeth.

**Top of the tooth**  The part of the tooth that bites on food. For both upper and lower teeth, the biting surface is the 'top' and the root is at the 'bottom'.

**Topical**  On top of the skin. A topical medicine is put on the skin.

**Traditions**  Practices, beliefs, or customs handed down from one generation to another by example or word of mouth.

**Treatment**  Care given by a health worker to fight an illness, attend to an injury, or prevent a new problem.

**Tropical**  Having to do with the tropics—the hot regions of the world.

**Tumor**  An abnormal mass of tissue without inflammation. Some tumors are due to cancer.

**Tweezers**  Small metal instrument for picking up cotton or small objects. Some persons use the word **forceps** for tweezers, but in this book, forceps are instruments for taking out a tooth.

**U**

**Ulcer**  A break in the skin or mucus membrane; a chronic open sore that can appear on the skin, gums, or gut.

**V**

**Vaccinations**  See **Immunizations**.

**Vaseline**  See **Petroleum jelly**.

**Vessels**  See **Blood vessels**.

**Virus**  Germs smaller than bacteria, which cause some infectious diseases, like measles or the common cold.
**Vitamins**  Protective foods that our bodies need to work properly.

**Volume**  The amount of space a thing occupies. We measure volume in liters, ml, gallons, etc.

**Weight**  The heaviness or lightness of a thing. We measure weight in kilograms, mg, pounds, etc.

**Wisdom teeth**  The 3rd molars, which grow into the mouth when a person is 16-22 years old.

**X-ray picture**  A special photograph that allows you to see bone, roots of teeth, etc., under the skin.
INDEX

A

Abscess, 87, 183
and gum bubble, 72
begins with a cavity, 6, 45
diagnosis and treatment, 87
flip chart presentation, 28-29
treat at once before infection reaches the
bone, 6
treat pregnant women now, 178-179
Acetaminophen (paracetamol)
dental kit supply, 164
dose for pain, 88
Acid
causes tooth decay and gum disease, 7,
48, 183
some sugars make acid more easily, 53
Adrenaline (epinephrine), 130, 165
Alcohol, for disinfecting without heat, 85
Allergies to medicines
and extractions, 147-148
penicillin warning, 165
Anemia, 116, 178, 183
Anesthetics, local, 130-131
dental kit supply, 167
Antibiotics, 88, 183
dental kit supply, 165
doses for tooth abscesses and other
problems, 88
injections, 166
precautions, 165
sulfadimidine, 117
warning on tetracycline, 61
Arkansas stone, 122
Aspirating syringe, 132, 169, 183
Aspirin, 88
correct dose for pain, 88, 165
dental kit supply, 164
do not hold against teeth, 165
B

Baby teeth, 60-63
ages when baby teeth come in, 41, 62
begin forming before birth, 60
do not cause diarrhea and fever, 63
how baby teeth grow and stay strong, 61
knocked out: diagnosis and treatment, 91
loose, 52
make space in mouth for permanent teeth, 62
marks on baby teeth, 60
why baby teeth are important, 62

Bacteria (See Germs)
Bandage, head, for a broken jaw, 104
Berry juice
used to show coating of germs on teeth, 51
Bicycle-powered dental drill, 145
Bleeding
and extractions, 147, 179
from socket: diagnosis and treatment, 112
how to place a suture, 155-156
in the mouth: possible causes (chart), 110
Bleach, for disinfecting without heat, 85
Blood
boil any instrument that has touched blood,
83
(Also see Bleeding)
Blood pressure, 112, 179
Blood vessel, 44
Bone
bone chips inside tooth socket, 160
broken: diagnosis and treatment, 102-106
damage from gum disease, 40
three main bones in the face, 102
Bones of animals, 39
Books on dental care, 180
Bottle feeding, 3, 61
Breast feeding, good for teeth, 3
Broken bone, 102-106
Broken root, 159
Broken tooth, 90
Brushing teeth (See Cleaning teeth)
Brushstick (homemade toothbrush), 4
Bubble (See Gum bubble)

C

Cancer, 119, 184
can begin with white lines inside mouth, 99
diagnosis, 119
look for a sore that does not heal, 100
Candy, 9
(Also see Sweet foods)
Cancrum oris (noma)
diagnosis and treatment, 115-118
Canker sores, diagnosis and treatment, 100
Cartridges of injectable anesthetic, 129-130,
167
Cavities (caries), 184
can begin as marks on baby teeth, 60
can become abscesses, 45
can make teeth hurt, 44
caused sometimes by baby bottles, 3
diagnosis and treatment, 86
Index C-D-E

Cavities (continued)
fill cavities before abscess forms, 6
flip chart presentation, 28-29
on neck of tooth, 86, 167
puppet show about, 31-32
school survey, 47
Cement fillings (See Fillings)
Chair for examinations and extractions, 73, 150
Cheek bone, 102
CHILD-to-child program, 22
Children
as health workers, 22
can clean their own teeth, 54
cannot learn well if their teeth hurt, 18
want to learn, 17
young children should not take aspirin, 88, 165
Cleaning instruments, 73, 82-85
after extractions, 161-162
after filling a tooth, 144
after scaling, 128
disinfecting without heat, 85
how to sterilize syringes, 132
pressure cooker, 84
sterilizing with steam, 83-84
wash your hands, too, 82
Cleaning teeth, 54, 67-70
can help sore gums, 7
CHILD-to-child activities, 22, 51
especially important for persons who take certain medicines, 109
experiment to find the best way, 56
flip chart presentation, 29
how to clean a baby’s teeth, 61
how to clean between teeth, 69-70
how to make a brushstick, 4
how to make a child’s toothbrush, 61
how to make waxed floss, 172
make it part of a daily school activity, 57
parents should clean children’s teeth, 11, 16, 61
pregnant women must take special care, 178
‘protected areas’ that are hard to clean, 4
soft toothbrush is best, 4, 68
(Also see Gum disease, Scaling teeth)
Coating of germs on the teeth, 48
Cola drink, in experiment on decay, 46
Cold sores (fever blisters)
diagnosis and treatment, 98
‘Colonies’ of germs on the teeth, 48, 185
Comparative diagnosis (telling similar problems apart), 77
Cotton rolls, 140, 167
‘Cowhorn’ forceps, 149
do not use on baby teeth, 154
Curette (for scaling teeth), 122

D
Demonstration, 24, 46
Dental floss, 69-70, 172
Dental kit, supplies for, 163-173
Dental mirror, 73, 171
Dental tools (See Instruments)
Dental workers, can visit schools, 33
Dentures, 157-158
bad dentures cause sore mouth, 101
sores under, diagnosis and treatment, 100
Diabetes, and extractions, 147-148
Diagnosis (See Examination and diagnosis)
Diagnosis charts, 77-80
loose tooth, 78
sore mouth, 79
sores, 79-80
swelling, 78
toothache, 77
trouble opening or closing mouth, 80
(Also see Comparative diagnosis)
Diet (See Nutrition)
Dilantin (diphenylhydantoin), 109
Dislocated jaw
after extraction, 161
diagnosis and treatment, 107
Disinfectant, cold
for cleaning certain instruments, 85, 168
Drama, for teaching about tooth problems, 24
Drawing pictures, 29
Drill, dental, 145-146
Dry socket, diagnosis and treatment, 111

E
Elevators for extractions, 149-150, 169
how to use, 152
Epilepsy
and swollen gums: diagnosis and treatment, 109
Epinephrine (adrenaline), 130, 165
Epulis, 127
Erythromycin, 88
dental kit supply, 164
Eugenol (oil of cloves), 139, 167
Examination and diagnosis, Chapter 6, 184
bleeding in the mouth (chart), 110
different problems come at different ages, 75
examining inside the mouth, 73
four steps to a good diagnosis, 74
how to check the gums, 72
look for sores, 72
questions that help you make a diagnosis, 71, 74
Examination and diagnosis (continued)
telling similar problems apart, 77
tetanus, 112
where to examine, 73
(Also see Diagnosis charts)

Excavator, 139
Expiration date, 164
Extractions, Chapter 11
before you begin—ask questions!, 147
four problems to watch for, 148
instructions: what to do afterward, 157-162
instruments needed, 148-150
problems afterward, 110, 159-161
three reasons to take out a tooth, 147

F
False teeth, 157-158
(Also see Dentures)
Fever blisters, diagnosis and treatment, 98
Filing teeth to correct a bad bite, 93
Filling tool, 139, 152

Fillings, Chapter 10
filling material, 139, 167
how to place, 140-144
instructions for after you place a filling, 144
instruments needed, 139
lost or broken: diagnosis and treatment, 86
permanent fillings, 145-146
puppet show about, 31-32
two kinds, 138
what a filling can do, 138
when not to place a filling, 137
when to place a filling, 138

Fish bone
can get caught under gums, 127

Flannel-boards, 26, 181
Flash, left inside socket after extraction, 160

Flip charts, 27-29, 181
example, 28-29

Flossing (cleaning between teeth), 69-70, 172, 185
Fluoride, 22, 68, 185
on neck of tooth, 86, 167
rinse and paste to prevent cavities, 167

Food (See Nutrition)
Forceps for extractions, 149, 169
Fracture (See Broken bone, tooth, root)

Germs, 185
discussion about, 49
health workers must not spread germs, 82-85
impossible to kill all germs in mouth, 48
where they hide, 83

Gingivae, gingivitis (See Gums, Gum disease)
’Go foods’ (energy foods), 65-66
warning about, 66

Grooves on teeth, 86, 167, 185
Gum boil (See Gum bubble)
Gum bubble, 46, 72
Gum disease, 50-51
description, 40, 50
diagnosis and treatment, 95
flip chart presentation, 28-29
home care for, 51
how gum disease makes teeth fall out, 40
learning activity about, 51
noma: diagnosis and treatment, 115-118
picture of, 7
possible cause of a sore mouth, 79
prevent gum disease during pregnancy, 178
serious gum disease: diagnosis and treatment, 8, 95-97, 115-118

Gum pocket, 50, 125, 185
Gums
definition, 185
importance of, 1, 35
infected gums (noma): diagnosis and treatment, 115-118
healthy and unhealthy gums: description, 50
how to examine, 72
swollen gums and epilepsy medicine, 109
swollen gums and pregnancy, 178-179
why gums can feel sore, 7, 50

Hands
wash before you touch someone’s mouth, 82

Head bandage for a broken jaw, 104
Heart disease, and extractions, 147-148
Heat, can lower swelling, 88

Hemorrhage, and extractions, 147-148
Hemostat, 155
Herpes virus, can cause fever blisters, 98
Hydrogen peroxide, 8
warning: do not use too much, 8
Hygiene (keeping clean), 82-85

Incisors, 37
Infection, 185
can pass from tooth to bone, 45
dental workers can infect others, 82
description of infected gums, 50
during pregnancy, 177-179
in sinus: diagnosis and treatment, 89
in spit gland: diagnosis and treatment, 113

Injections, Chapter 9, 166, 185
how to give injections to children, 135
injections of antibiotics, 166
sterilization of syringes, 132
two types of syringe, 129-130
use an aspirating syringe, 132
instructions for after you give an injection, 136

Instructions
what to do after extracting, 157-162
what to do after injecting, 136
what to do after placing a temporary filling, 144
what to do after scaling, 127

Instruments, 169-173, 185
boil any instrument that has touched blood, 83
buying instruments, 173
for examination, 73
for extractions, 148-150
for filling teeth, 139
for scaling, 122
making your own instruments, 170-172
(Also see Cleaning instruments)

I.R.M. (Intermediate Restorative Material), 139

J

Jamaica
dental workers' description of gum disease, 40

Jaw bone, 39
broken: diagnosis and treatment, 102-106
dislocated: after an extraction, 161-162
dislocated: diagnosis and treatment, 107
three main bones in face, 102

Joint, 185
pain in: diagnosis and treatment, 108-109

L

Learning (See Teaching)
Lidocaine (lignocaine), 130
dental kit supply, 167

Ligature wire, 104, 185

Loose teeth, 52
diagnosis and treatment, 93
possible causes (charts), 78, 93

M

Main food, 65-66
Malaria, can contribute to noma, 115
Malnutrition, 185
cavities can help cause, 60
often made worse by Vincent's Infection, 96
(Also see Nutrition)

Mango string, can get caught under gums, 127

Measles
can cause dry, sore lips, 101
can contribute to noma, 115

Medicines in dental kit, 164-166
Mepivacaine, 131

Milk-oil drink
for persons who cannot eat properly, 105

Mirror, 73, 171

Molars, 37, 41, 186
ages when molars grow in, 41
baby molars, 62
first permanent molar is often the first permanent tooth, 62
infection in new molar: diagnosis and treatment, 94
new molar can cause face to swell, 64
often grow in badly, 41
taking care of, 64

Mouth
trouble opening and closing (chart), 80
white lines inside the mouth can be cancer, 99

N

Neck of a tooth, grooves in, 86, 167

Needle, hypodermic
disposable, for oral anesthetic, 167
used to wire a broken jaw, 106

Nerve of a tooth, 44, 186
main trunks and small branches, 130-131

Nerve treatment (See Root canal treatment)
Noma (cancrum oris)
diagnosis and treatment, 115-118
prevention, 118

Nutrition, 65-66, 186
eat a mixture of foods, 11, 65-66
eat enough food, 65
flip chart presentation, 29
foods for persons who cannot eat properly, 105
foods that make gums stronger, 7, 8
foods that we cannot eat without teeth, 36
good and bad foods, 53
good and bad sweets, 3
grow foods in your own garden, 11
Nutrition (continued)
   pregnant women need Vitamin C, 178
   tooth pain can interfere with nutrition, 60
Nystatin, 99, 164

Oil
   prevents rust when sterilizing instruments, 83
Oil of cloves, 139

Pain
   aspirin or acetaminophen can help, 88
Penicillin, 87-88, 164-166
   almost always taken by mouth, 87
   dental kit supply, 164
   dose taken by mouth, 88, 164
   injectable, 166
   precautions, 165
   take entire dose, 87, 165
Permanent teeth, 41, 52, 186
   knocked out: diagnosis and treatment, 91
   need good baby teeth before them, 62
Phenytoin (See Dilantin)
Pictures
   as a teaching aid, 26, 35-36
   tracing, 29
Plaque, 48, 186
   disclosing solution (berry juice), 51
Plays, 24
Posters, 26, 181
Pregnancy, 177-179
   and dental problems, 75, 177-179
   woman must take special care, 95
   story about, 177-178
Pressure cooker for sterilizing instruments, 84
Prevention, 33, Chapter 5, 186
   early treatment is a form of prevention, 59
   foods that are good and bad, 53
   (Also see Cleaning teeth, Nutrition)
Probe, 73, 171
Pronunciation, why teeth are important for, 36
Puppet shows, 30-32
   example, 31-32
Puzzles, 25

R
Records, 174, 186
Reports, 175, 186
Rinsing the mouth during pregnancy, 178
   with hydrogen peroxide, 8
   with salt water, 7
Root of the tooth, 39
   broken: diagnosis and treatment, 159
   count roots before taking out a tooth, 153
   has a nerve and blood vessel, 44
   pushed into sinus, 160
Root canal (special nerve treatment), 45
Root fibers, 39, 186

S
Salivary gland (spit gland)
   infection in: diagnosis and treatment, 113
Salt water rinse, 7
Scalers, 122
Scaling teeth, Chapter 8
   instruction for after you scale teeth, 127
   instruments for, 122, 169
   only scale teeth of someone who will keep teeth clean, 121
'Scatter!' (game), 48-49
School
   cleaning teeth can be a daily health activity, 57, 167
   school lunch program, 55
   (Also see Teaching)
Scientific method for making diagnosis, 74
Sewing up a wound (suturing), 155-156
Sharpening stone, 122
Shots (See Injections)
Sinus
   infected, diagnosis and treatment, 89
   root pushed into sinus, 160
Slides for teaching about dental health, 180
Socket, 187
   broken root inside, 159
   painful (dry socket): diagnosis and treatment, 111
   painful, 161
Soreness in mouth, possible causes (chart), 79
Sores
   at corners of mouth: diagnosis and treatment, 101
   different problems come at different ages, 75
   from a denture: diagnosis and treatment, 100
   on the face, 114
   on lips, cheek, and tongue, 72
   types of face sores (chart), 80
   types of mouth sores (chart), 79
Spatula, for cement fillings, 139
Spit gland
   infection in: diagnosis and treatment, 113
Index S-T

Spoon
  for extractions, 149
  for fillings, 139
  making your own, 172

Sterilization, 83, 187
  with steam, 84

Story telling, 24, 177-179
  about pregnancy and dental care, 177-178

Sugar
  some kinds make acid more easily, 53
  sugar cane is not as bad as candy, 9
  (Also see Sweet foods)

Sulfadimidine, 117

Surveys, 176, 187
  as a way of learning numbers, 22, 23
  counting cavities, 47, 176
  counting teeth, 42-43
  to find the best way to clean teeth, 56

Sutures, 155-156

Sweet foods, 9, 44, 53
  avoid fizzy drinks, 11
  can cause cavities and gum disease, 6-7
  learning activities, 46
  some are called ‘go foods’, 65-66

Swelling
  and epilepsy medicine, 109
  and pregnancy, 178-179
  after extractions, 110, 160
  different problems come at different ages, 75
  from a tooth abscess, 6, 45
  heat can lower swelling, 88
  may be a new molar coming in, 64
  possible causes (chart), 78

Syringes
  aspirating, 132, 166, 169
  for injections: two kinds, 129-130
  (Also see Injections)

Tartar, 50, 187
  can be a sign of gum disease, 76
  how to scale, 121
  makes gums sore, 8

Teachers
  can teach without dental worker’s help, 34

Teaching
  ‘association of ideas’, 12
  by example, 55
  community can be part of classroom, 23
  each person can teach another, 12
  finding the best way to teach, 13-16
  finding the best place to teach, 15
  how to scale (scrape away) tartar, 121
  learn from the people, 13
  let students discover for themselves, 18, 21
  repetition helps people remember, 15
  teach yourself before teaching others, 2
  teaching family and friends, Chapter 2
  teaching school children, Chapters 3, 4
  teaching so that learning can happen, 19-23
  with demonstrations, 24
  with drama, 24
  with posters and pictures, 26
  with puzzles, 25
  with story telling, 177-179
  (Also see School)

Teeth
  and gums, 1
  broken, 90
  four problems to watch for, 71
  how many teeth we should have, 41
  importance of, 1, 35
  injuries to: diagnosis and treatment, 90-92
  learning about anatomy, 47
  loose: diagnosis and treatment, 52, 93
  naming teeth with numbers, 174
  new tooth coming in:
    diagnosis and treatment, 94, 95
    rotting in cola drink (experiment), 46
    what holds teeth, 39
    what makes teeth hurt, 44
    why some teeth look different, 37
  (Also see Baby teeth, Loose teeth)

Teeth, false, 157-159
  (Also see Dentures)

Teeth, taking out, Chapter 11
  (Also see Extractions)

Teething: diagnosis and treatment, 95

Tension
  can cause pain in joint, 108-109

Tetanus
  diagnosis, 112

Tetracycline
  can hurt baby teeth, 61, 164

Theater, 24

Thrush: diagnosis and treatment, 99

Tongue blade (tongue depressor), 73, 168

Tools (See Instruments)

Tooth (See Teeth)

Toothbrushes
  possible causes (chart), 77
  why teeth hurt, 44
  (Also see Abscess)

Toothache
  possible causes (chart), 77
  why teeth hurt, 44
  (Also see Abscess)

Toothbrushes
  how to make your own, 4-5, 21
  how to make a brush smaller for a child, 61
  soft is best, 4

Tooth decay
  can touch nerve and cause an abscess, 6
  flip chart presentation, 28
  (Also see Cavities)
Tooth injuries
  broken tooth: diagnosis and treatment, 90
  booth knocked out: diagnosis and treatment 91-92

Toothpaste, 5, 67

Tracing pictures, 29

Traditional beliefs, 10, 13, 187
  about pregnancy, 177
  building new traditions from old ones, 14

Treadle-powered dental drill, 145

Treatment, Chapter 7
  can be given during pregnancy, 177-179
  early treatment prevents serious problems, 2
  list of treatments, 81

Trench mouth: diagnosis and treatment, 96

Tumor, diagnosis and treatment, 119

Tweezers, how to make, 171

Vegetable soup (special drink)
  for those who cannot eat properly, 105

Vincent's Infection of the gums
  can worsen and become noma, 115-118
  diagnosis and treatment, 96-97

Vitamin C, 178

Wax, to replace a knocked-out tooth, 92

Wire, ligature, 104

Wisdom teeth (3rd Molars) (See Molars)

X-rays
  for knocked-out teeth, 92
  to look at new tooth growing in, 94
  warning about pregnant women, 179

Zephiran, 168

Zinc oxide, 139, 167
